# 9+2-Bit Parity Generator/ Checker

The MC10170 is a 11-bit parity circuit, which is segmented into 9 data bits and 2 control bits.

Output A generates odd parity on 9 bits; that is, Output A goes high for an odd number of high logic levels on the bit inputs in only 2 gate delays.

The Control Inputs can be used to expand parity to larger numbers of bits with minimal delay or can be used to generate even parity. To expand parity to larger words, the MC10170 can be used with the MC10160 or other MC10170's. The MC10170 can generate both even and odd parity.

 $P_D = 300 \text{ mW typ/pkg (No Load)}$ 

 $t_{pd} = 2.5 \text{ ns typ(Control Inputs to B Output)}$ 

4.0 ns typ (Data Inputs to A Output)

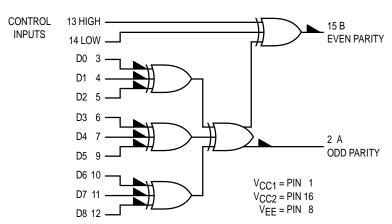

6.0 ns typ (Data Inputs to B Output)

 $t_f, t_f = 2.0 \text{ ns typ } (20\%-80\%)$ 

# MC10170

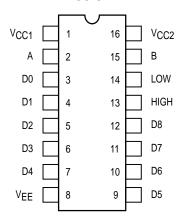

## **LOGIC DIAGRAM**

INPUTS	OUTPUTS				
Sum of D Inputs at High Level	Odd Parity	Even Parity

Each MECL 10,000 series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 linear fpm is maintained. Outputs are terminated through a 50–ohm resistor to –2.0 volts. Test procedures are shown for only one gate. The other gates are tested in the same manner.

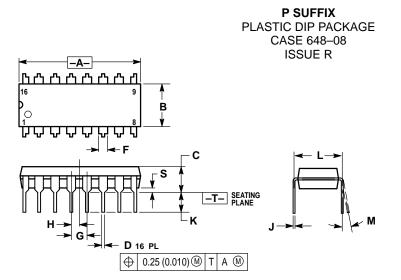

## **OUTLINE DIMENSIONS**

#### NOTES:

- DIMENSIONING AND TOLERANCING PER
- ANSI Y14.5M, 1982. CONTROLLING DIMENSION: INCH.
- DIMENSION L TO CENTER OF LEAD WHEN FORMED PARALLEL.
- DIMENSION F MAY NARROW TO 0.76 (0.030)
  WHERE THE LEAD ENTERS THE CERAMIC
