

## OVERVIEW

The SM5877AM is a 3rd-order  $\Sigma\Delta$ , 2-channel D/A converter LSI for digital audio reproduction equipment. It also incorporates an 8-times oversampling digital filter and analog, post-converter lowpass filters.

The SM5877AM has digital deemphasis filter, attenuator, and soft mute circuits built-in. Double-speed operation and low-voltage operation are also supported.

The SM5877AM operates from a 2.7 to 5.5 V supply, and is available in 24-pin SSOPs.

## FEATURES

- 2.7 to 5.5 V operating supply voltage range
- 4.5 to 5.5 V operating supply voltage range for double-speed mode
- 44.1 kHz sampling frequency
- Normal (384fs) and double-speed (192fs), 16.9344 MHz system clock
- 16.9344 MHz crystal oscillator circuits built-in
- 16-bit, MSB first, rear-packed serial data input format ( $\leq 64$ fs bit clock)
- 8-times oversampling digital filter
  - 32 dB stopband attenuation
  - $\pm 0.05$  dB passband ripple
- Deemphasis filter operation
  - 36 dB stopband attenuation
  - $-0.09$  to  $+0.23$  dB deviation from ideal deemphasis filter characteristics
- Attenuator
  - 6-bit attenuator (64 steps)
  - Soft mute function when MODE is HIGH (approx. 1024/fs total muting time)
- Built-in infinity-zero detector
- $\Sigma\Delta$  2-channel D/A converter
  - 3rd-order noise shaper
  - 32fs oversampling (16fs for double-speed mode)
- 3rd-order analog, post-converter lowpass filters built-in (165 kHz cut-off frequency)
- 24-pin SSOP
- Molybdenum-gate CMOS process

## PINOUT

## PACKAGE DIMENSIONS

Unit: mm

### 24-pin SSOP

### Package Marking

**BLOCK DIAGRAM****PIN DESCRIPTION**

Number	Name	I/O	Description
1	MUTE	Ip	When MODE is HIGH: Soft mute ON/OFF control. Mute is active when HIGH. When MODE is LOW: Attenuator level direction control. The attenuator direction is down when HIGH.
2	DEEM	Ip	Deemphasis control. Deemphasis is ON when HIGH, and OFF when LOW.
3	CKO	O	16.9344 MHz clock output
4	DVSS		Digital ground pin
5	BCKI	Ip	Bit clock input pin
6	DI	Ip	Serial data input pin
7	DVDD		Digital supply pin
8	LRCI	Ip	Input sample data rate (fs) clock input pin. Left-channel input when HIGH, and right-channel input when LOW.
9	TSTN	Ip	Test pin. Test mode when LOW.

Number	Name	I/O	Description
10	TO1	O	Test output 1. Normally LOW.
11	AVDDL		Left-channel analog supply pin
12	LO	O	Left-channel analog output
13	AVSS		Analog ground pin
14	RO	O	Right-channel analog output
15	AVDDR		Right-channel analog supply pin
16	MUTEO	O	Infinity-zero detection output
17	XVDD		Crystal oscillator supply pin
18	XTI	I	Crystal oscillator or 16.9344 MHz external clock input pin
19	XTO	O	Crystal oscillator output pin
20	XVSS		Crystal oscillator ground pin
21	DS	Ip	Double/Normal-speed mode select. Double-speed mode when HIGH.
22	RSTN	Ip	Reset pin. Reset when LOW.
23	MODE	Ip	Soft mute/attenuator mode select. Soft mute mode when HIGH.
24	ATCK	Ip	Attenuator level setting clock. Disabled when MODE is HIGH.

## SPECIFICATIONS

### Absolute Maximum Ratings

DV<sub>SS</sub> = AV<sub>SS</sub> = XV<sub>SS</sub> = 0 V, AV<sub>DD</sub> = AV<sub>DDL</sub> = AV<sub>DDR</sub>

Parameter	Symbol	Rating	Unit
Supply voltage range	DV <sub>DD</sub> , AV <sub>DD</sub> , XV <sub>DD</sub>	-0.3 to 7.0	V
Input voltage range <sup>1</sup>	V <sub>IN1</sub>	DV <sub>SS</sub> - 0.3 to DV <sub>DD</sub> + 0.3	V
XTI input voltage range	V <sub>IN</sub>	XV <sub>SS</sub> - 0.3 to XV <sub>DD</sub> + 0.3	V
Storage temperature range	T <sub>stg</sub>	-40 to 125	°C
Power dissipation	P <sub>D</sub>	250	mW
Soldering temperature	T <sub>sld</sub>	255	°C
Soldering time	t <sub>sld</sub>	10	s

1. Pins MUTE, DEEM, BCKI, DI, LRCI, TSTN, DS, RSTN, MODE and ATCK.  
Also applicable during supply switching.

### Recommended Operating Conditions

Normal-voltage: DV<sub>SS</sub> = AV<sub>SS</sub> = XV<sub>SS</sub> = 0 V, AV<sub>DD</sub> = AV<sub>DDL</sub> = AV<sub>DDR</sub>

Parameter	Symbol	Rating	Unit
Supply voltage range	DV <sub>DD</sub> , AV <sub>DD</sub> , XV <sub>DD</sub>	4.5 to 5.5	V
Supply voltage variation	DV <sub>DD</sub> - XV <sub>DD</sub> , DV <sub>DD</sub> - AV <sub>DD</sub> , XV <sub>DD</sub> - AV <sub>DD</sub> , DV <sub>SS</sub> - XV <sub>SS</sub> , DV <sub>SS</sub> - AV <sub>SS</sub> , XV <sub>SS</sub> - AV <sub>SS</sub>	±0.1	V
Operating temperature range	T <sub>opr</sub>	-40 to 85	°C

Low-voltage: DV<sub>SS</sub> = AV<sub>SS</sub> = XV<sub>SS</sub> = 0 V, AV<sub>DD</sub> = AV<sub>DDL</sub> = AV<sub>DDR</sub>

Parameter	Symbol	Rating	Unit
Supply voltage range	DV <sub>DD</sub> , AV <sub>DD</sub> , XV <sub>DD</sub>	2.7 to 4.5	V
Supply voltage variation	DV <sub>DD</sub> – XV <sub>DD</sub> , DV <sub>DD</sub> – AV <sub>DD</sub> , XV <sub>DD</sub> – AV <sub>DD</sub> , DV <sub>SS</sub> – XV <sub>SS</sub> , DV <sub>SS</sub> – AV <sub>SS</sub> , XV <sub>SS</sub> – AV <sub>SS</sub>	±0.1	V
Operating temperature range	T <sub>opr</sub>	-20 to 70	°C

## DC Electrical Characteristics

**Overall frequency characteristic (deemphasis ON)****Passband characteristic (deemphasis ON)**

## AC Analog Characteristics

Normal-voltage: DV<sub>SS</sub> = AV<sub>SS</sub> = XV<sub>SS</sub> = 0 V, DV<sub>DD</sub> = AV<sub>DD</sub> = XV<sub>DD</sub> = 5 V, AV<sub>DD</sub> = AV<sub>DDL</sub> = AV<sub>DDR</sub>, DS = 0 V, DEEM = 0 V, crystal oscillator frequency f<sub>OSC</sub> = 16.9344 MHz, T<sub>a</sub> = 25 °C

Parameter	Symbol	Condition	Rating			Unit
			min	typ	max	
Total harmonic distortion	THD + N	1 kHz, 0 dB	–	0.004	0.010	%
LSI output level	V <sub>out1</sub>	1 kHz, 0 dB	1.1	1.2	1.3	V <sub>rms</sub>
Evaluation board output level	V <sub>out2</sub>	1 kHz, 0 dB	–	1.2	–	V <sub>rms</sub>
Dynamic range	D.R	1 kHz, –60 dB	91	97	–	dB
Signal-to-noise ratio <sup>1</sup>	S/N	1 kHz, 0/–∞ dB	90	96	–	dB
Channel separation	Ch. Sep	1 kHz, –∞/0 dB	87	93	–	dB

1. Signal-to-noise is measured following a device reset, with DATA = 0 (DI = LOW). Under these conditions, the signal-to-noise ratio includes noise-shaper noise.

Low-voltage: DV<sub>SS</sub> = AV<sub>SS</sub> = XV<sub>SS</sub> = 0 V, DV<sub>DD</sub> = AV<sub>DD</sub> = XV<sub>DD</sub> = 3 V, AV<sub>DD</sub> = AV<sub>DDL</sub> = AV<sub>DDR</sub>, DS = 0 V, DEEM = 0 V, crystal oscillator frequency f<sub>OSC</sub> = 16.9344 MHz, T<sub>a</sub> = 25 °C

Parameter	Symbol	Condition	Rating			Unit
			min	typ	max	
Total harmonic distortion	THD + N	1 kHz, 0 dB	–	0.009	0.030	%
LSI output level	V <sub>out1</sub>	1 kHz, 0 dB	0.65	0.71	0.77	V <sub>rms</sub>
Evaluation board output level	V <sub>out2</sub>	1 kHz, 0 dB	–	0.71	–	V <sub>rms</sub>
Dynamic range	D.R	1 kHz, –60 dB	74	86	–	dB
Signal-to-noise ratio <sup>1</sup>	S/N	1 kHz, 0/–∞ dB	74	84	–	dB
Channel separation	Ch. Sep	1 kHz, –∞/0 dB	72	82	–	dB

1. Signal-to-noise is measured following a device reset, with DATA = 0 (DI = LOW). Under these conditions, the signal-to-noise ratio includes noise-shaper noise.

## AC Measurement Circuit and Conditions

### Measurement circuit block diagram

### Measurement conditions

Parameter <sup>1</sup>	Symbol	3346A left/right-channel selector switch	AD725C distortion analyzer with built-in filter
Total harmonic distortion	THD + N	THRU	20 kHz lowpass filter ON 400 Hz highpass filter OFF
Output level	$V_{\text{out}}$	D-RANGE	
Dynamic range	DR	THRU	20 kHz lowpass filter ON 400 Hz highpass filter OFF JIS A filter ON
Signal-to-noise ratio	S/N	THRU	20 kHz lowpass filter ON 400 Hz highpass filter OFF
Channel separation	Ch. Sep	THRU	20 kHz lowpass filter ON 400 Hz highpass filter OFF

1. Pins LO and RO should have an output load of 10 k $\Omega$  (min).

## Measurement circuit

## FUNCTIONAL DESCRIPTION

### System Clock/Speed Switching (XTI, XTO, CKO, DS)

The system clock on XTI can be set to run at one of two speeds, 384fs (normal speed) or 192fs (double-speed), where  $f_s$  is the input frequency on LRCI. The speed for CD playback is set by the input level on DS, as shown in table 1. The system clock should be fixed at 16.9344 MHz.

Table 1. System clock select

Parameter	Symbol	DS	
		LOW (normal speed)	HIGH (double speed)
XTI input clock frequency	$f_{XI}$ ( $= 1/t_{XI}$ )	384fs	192fs
CD playback XTI frequency	$f_{XI}$	16.9344 MHz at $f_s = 44.1$ kHz	16.9344 MHz at $f_s = 88.2$ kHz
CKO output clock frequency	$f_{CO}$	384fs	192fs
Internal system clock period	$T_{SYS}$	$t_{XI}$	$t_{XI}$

Note that the input clock accuracy and signal-to-noise ratio greatly influence the AC analog characteristics. Accordingly, care should be taken to ensure that the clock is free from jitter.

The system clock can be controlled by a crystal oscillator comprising a crystal connected between XTI and XTO and the built-in CMOS inverter. Alternatively, an external system clock can be input on XTI. As the internal CMOS inverter has a feedback resistor, the external clock can be AC coupled to XTI. The system clock is output on CKO.

### System Reset (RSTN)

The device should be reset in the following cases.

- At power ON
- When LRCI and/or the system clock XTI stop, or other abnormalities occur.

The device is reset by applying a LOW-level pulse on RSTN. At system reset, the internal arithmetic operation and output timing counter are synchronized on the next LRCI rising edge, as shown in figure 1.

Figure 1. System reset timing

### Audio Data Input (DI, BCKI, LRCI)

The digital audio data is input on DI in MSB-first, 2s-complement, 16-bit serial format.

Serial data bits are read into the SIPO register (serial-to-parallel converter register) on the rising edge of the bit clock BCKI.

The arithmetic operation and output timing are independent of the input timing. Accordingly, after a reset,

as long as the clock frequency ratio between LRCI and the system clock XTI is maintained, phase differences between LRCI, BCKI and the system clock XTI do not affect the functional operation. Also, any jitter present on the data input clock does not appear as output jitter.

The bit clock frequency on BCKI should be between 32fs and 64fs.

## Deemphasis Filter (DEEM)

The built-in digital deemphasis filter is designed to operate at 44.1 kHz. Deemphasis is ON when DEEM is HIGH, and OFF when DEEM is LOW.

## Attenuation (MDT, MCK, MLEN)

The digital attenuation mode is selected when MODE is LOW. The attenuator operates by multiplying the internal 6-bit up/down counter's output data with the signal data.

The direction of the 6-bit up/down counter is controlled by the level on MUTE (down when MUTE is HIGH, and up when MUTE is LOW). The count is advanced on the rising edge of ATCK.

When the count reaches 0 (down) or 63 (up), the counter automatically stops.

The gain is set by the counter contents DATT as follows.

$$\text{Gain} = 20 \times \log\left(\frac{\text{DATT}}{63}\right) [\text{dB}]$$

Upon system initialization or when MODE changes state, DATT is set to 63, which corresponds to the maximum gain of 0 dB as shown in table 2.

Table 2. Attenuator gain

DATT	Gain (dB)						
63	0.0	47	-2.545	31	-6.160	15	-12.465
62	-0.139	46	-2.732	30	-6.444	14	-13.064
61	-0.280	45	-2.923	29	-6.739	13	-13.708
60	-0.424	44	-3.118	28	-7.044	12	-14.403
59	-0.570	43	-3.317	27	-7.360	11	-15.159
58	-0.718	42	-3.522	26	-7.687	10	-15.987
57	-0.869	41	-3.731	25	-8.028	9	-16.902
56	-1.023	40	-3.946	24	-8.383	8	-17.925
55	-1.180	39	-4.166	23	-8.752	7	-19.085
54	-1.339	38	-4.391	22	-9.138	6	-20.424
53	-1.501	37	-4.623	21	-9.542	5	-22.007
52	-1.667	36	-4.861	20	-9.966	4	-23.946
51	-1.835	35	-5.105	19	-10.412	3	-26.444
50	-2.007	34	-5.357	18	-10.881	2	-29.966
49	-2.183	33	-5.617	17	-11.378	1	-35.987
48	-2.362	32	-5.884	16	-11.904	0	$-\infty$

## Soft Mute (SMUTE)

Soft mute mode is selected when MODE is HIGH. The up/down counter is switched to internal clock drive, and soft mute operation is controlled by MUTE only.

When MUTE goes HIGH, the up/down counter counts down. The total time to go from 0 to maximum mute is 1024/fs. This corresponds to approximately 23.2 ms at fs = 44.1 kHz.

When MUTE is LOW, soft mute is released. The attenuation counter output counts up, increasing the gain. The time taken to return to 0 dB is also 1024/fs. Soft mute operation is shown in figure 2.

Upon system initialization or when MODE changes state, mute is released, which corresponds to the maximum gain of 0 dB.

### Infinity-Zero (MUTEO)

The SM5877AM outputs an infinity-zero detection output signal under the following circumstances.

- From immediately after a reset input on RSTN until the initialization cycle finishes and the first data cycle occurs.
- When an infinity-zero occurs in the input data. When an infinity-zero is detected, a period of  $2^{14} \times (1/\text{fs}) \approx 0.37$  seconds takes place before MUTEO goes HIGH.

Figure 2. Soft mute operation example

Figure 3. MUTEO output timing
