

## DUAL VOLTAGE REGULATOR

- $V_{OUT1} = +3.3V$  FIXED
- $V_{OUT2} = 1.25$  TO  $3.0V$  ADJUSTABLE
- GUARANTEED OUTPUT1 CURRENT: 1A
- GUARANTEED OUTPUT2 CURRENT: 1A
- $\pm 2\%$  OUTPUT TOLERANCE (AT  $25^{\circ}C$ )
- TYPICAL DROPOUT 1.1V  
( $I_{OUT1} = I_{OUT2} = 1A$ )
- INTERNAL POWER AND THERMAL LIMIT
- STABLE WITH LOW ESR OUTPUT CAPACITOR
- OPERATING TEMPERATURE RANGE:  $0^{\circ}C$  TO  $125^{\circ}C$
- AVAILABLE IN PPAK AND SPAK-5L (PowerFlex™) PACKAGE

### DESCRIPTION

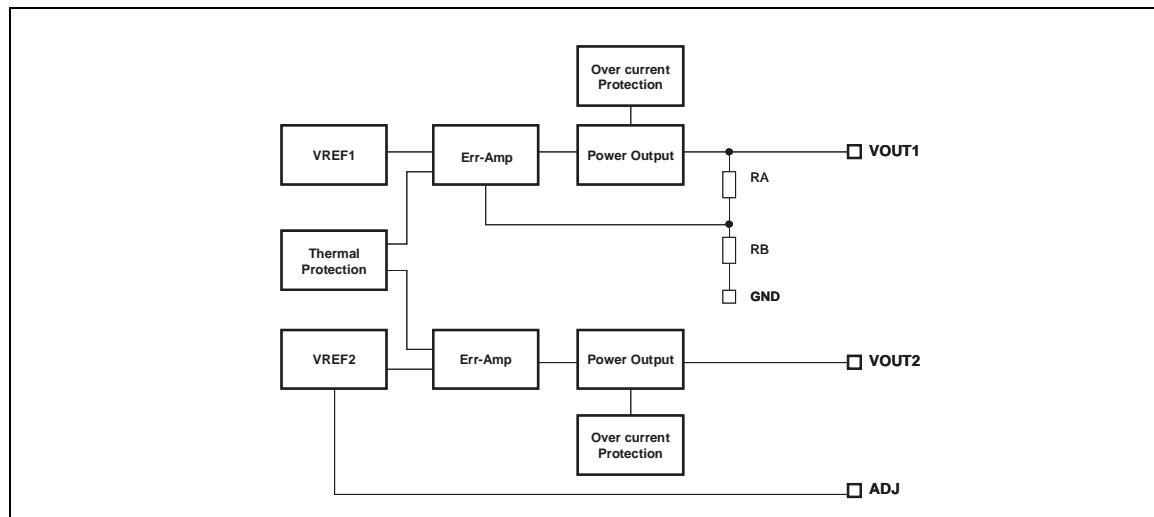

Specifically designed for data storage applications, this device integrates two voltage regulators, each one able to supply 1A. It is assembled in PPAK and in a new surface mounting package named SPAK (PowerFlex™) at 5 pins. The first regulator block supply 3.3V to power the Read Channel and Memory Chips requiring this voltage. The second one is an adjustable output voltage from 1.25V to 3.0V that

could power several kind of different micro-controllers.

Both outputs are current limited and overtemperature protected.

The very good thermal performances of the package SPAK with only  $2^{\circ}C/W$  of Thermal Resistance Junction to Case is important to underline.

$t_{TR}$	Transient Response	$I_O = 10$ to $500mA$ $t_{rise} = t_{fall} = 1\mu s$ (Note 3, 5)		<1		$\mu s$
$I_{SC1}$	Current Limit 1	$R_L = 0$ $T_j = 0$ to $125^\circ C$	1			A
$I_{O1}$	Minimum Load Current 1	$T_j = 0$ to $125^\circ C$ (Note 4)	0			mA
SVR1	Supply Voltage Rejection	$V_I = 5 \pm 0.25V$ $I_{O1} = 100 mA$ $T_j = 0$ to $125^\circ C$ (Note 5)				dB
		$f_i = 100Hz$	60	68		
		$f_i = 1KHz$	60	70		
		$f_i = 10KHz$	50	65		
		$f_i = 100KHz$	30	38		
	Thermal Regulation	$I_O = 1A$ , $t_{PULSE} = 30ms$ (Note 5)		0.1		%/W
eN1	Output Noise	$B = 10Hz$ to $10KHz$ (Note 5)		40		$\mu V_{rms}$
$\Delta V_{O1}$	Temperature Stability	$T_j = 0$ to $125^\circ C$ (Note 5)		0.5		% $V_O$
$\Delta V_{O1}$	Long Term Stability	$T_j = 125^\circ C$ , 1000Hrs (Note 5)		0.3		% $V_O$

Note 1: Low duty cycle pulse testing with Kelvin connections are required in order to maintain accurate data

Note 2: Dropout Voltage is defined as the minimum differential voltage between  $V_I$  and  $V_O$  required to maintain regulation at  $V_O$ . It is measured when the output voltage drops 1% below its nominal value.

Note 3: Transient response is defined with a step change in load from 10mA to 500mA as the time from the load step until the output voltage reaches its minimum value.

Note 4: Minimum load current is defined as the minimum current required at the output in order for the output voltage to maintain regulation.

Note 5: Guaranteed by design, not tested in production.

## APPLICATION HINTS

### EXTERNAL CAPACITORS

Like any low-dropout regulator, the ST2L01 requires external capacitors for stability. We suggest to solder both capacitors as close as possible to the relative pins (1, 2 and 5).

### INPUT CAPACITORS

An input capacitor, whose value is at least  $1\mu\text{F}$ , is required; the amount of the input capacitance can be increased without limit if a good quality tantalum or aluminum capacitor is used.

SMS X7R or Y5V ceramic multilayer capacitors could not ensure stability in any condition because of their variable characteristics with Frequency and Temperature; the use of this capacitor is strictly related to the use of the output capacitors. For more details read the "OUTPUT CAPACITOR SECTION".

The input capacitor must be located at a distance of not more than 0.5" from the input pin of the device and returned to a clean analog ground.

### OUTPUT CAPACITOR

The ST2L01 is designed specifically to work with Ceramic and Tantalum capacitors.

Special care must be taken when a Ceramic multilayer capacitor is used.

Special care must be taken when a Ceramic multilayer capacitor is used.

Due to their characteristics they can sometimes have an ESR value lower than the minimum required by the ST2L01 and their relatively large capacitance can change a lot with the ambient temperature.

The test results of the ST2L01 stability using multilayer ceramic capacitors show that a minimum value of  $1\mu\text{F}$  is needed for the adjustable regulator (set to 2.5V). This value can be increased up to  $10\mu\text{F}$  when a tantalum capacitor is used on the input. A higher value  $C_O$  can have an ESR lower than the accepted minimum.

When a ceramic capacitor is used on the input the output capacitance must be in the range from  $1\mu\text{F}$

to  $2.2\mu\text{F}$  if  $C_I=1\mu\text{F}$ , and from  $1\mu\text{F}$  to  $4.7\mu\text{F}$  if  $C_I=2.2\mu\text{F}$ .

The 3.3V regulator stable with a 470nF capacitor. This value can be increased up to  $10\mu\text{F}$  if a tantalum capacitor is used on the input. A higher value  $C_O$  can have an ESR lower than the accepted minimum.

When a ceramic capacitor is used in the input the output capacitance must be in the range from  $1\mu\text{F}$  to  $2.2\mu\text{F}$  if  $C_I=1\mu\text{F}$ , and from  $1\mu\text{F}$  to  $4.7\mu\text{F}$  if  $C_I=2.2\mu\text{F}$ .

Surface-mountable solid tantalum capacitors offer a good combination of small physical size for the capacitance value and ESR in the range needed by the ST2L01. The test results show good stability for both outputs with values of at least  $1\mu\text{F}$ . The value can be increased without limit for even better performance such a transient response and noise.

**IMPORTANT;** The output capacitor must maintain its ESR in the stable region over the full operating temperature to assure stability. Also, capacitor tolerance and variation with temperature must be considered to assure that the minimum amount of capacitance is provided at all times. For this reason, when a ceramic multilayer capacitor is used, the better choice for temperature coefficient is the X7R type, which holds the capacitance within  $\pm 15\%$ . The output capacitor should be located not more than 0.5" from the output pins of the device and returned to a clean analog ground.

### ADJUSTABLE REGULATOR

The ST2L01 has a 1.25V reference voltage between the output and the adjustable pins (respectively pin 4 and 2). When a resistor R2 is placed between these two terminals a constant current flows through R2 and down to R1 to set the overall ( $V_{O2}$  to GND) output voltage.

Minimum load current is 1mA.

$I_{ADJ}$  is very small (typically  $35\mu\text{A}$ ) and constant; in the  $V_O$  calculation it can be ignored.
