- Voltage translation (5V to 3.3V)

DESCRIPTION:

The QS32XL383 provides two sets of ten high-speed CMOS TTL-compatible bus switches. The low ON resistance of the QS32XL383 allows inputs to be connected to outputs without adding propagation delay and without generating additional ground bounce noise. The Bus Enable (\overline{BE}) signal turns the switches on. The Bus Exchange (BX) signal provides nibble swap of the AB and CD pairs of signals. This exchange configuration allows byte swapping of buses in systems. It can also be used as a 10-wide 2-to-1 multiplexer and to create low delay barrel shifters, etc.

The QS32XL383 is characterized for operation at -40°C to +85°C.

POWER SUPPLY CHARACTERISTICS

Symbol	Parameter	Test Conditions ⁽¹⁾	Max.	Unit

ΔI _{CC}	Power Supply Current per Control Input HIGH ⁽²⁾	V _{CC} = Max., V _{IN} = 3.4V, f = 0	2.5	mA
I _{CCD}	Dynamic Power Supply Current per MHz ⁽³⁾	V _{CC} = Max., A - D pins open Control Inputs Toggling at 50% Duty Cycle	0.25	mA/MHz

NOTES:

- For conditions shown as Min. or Max., use the appropriate values specified under DC Electrical Characteristics.
- Per TLL driven input (V_{IN} = 3.4V, control inputs only). A - D pins do not contribute to ΔI_{CC}.
- This current applies to the control inputs only and represents the current required to switch internal capacitance at the specified frequency. The A - D inputs generate no significant AC or DC currents as they transition. This parameter is guaranteed but not production tested.

SWITCHING CHARACTERISTICS OVER OPERATING RANGE

T_A = -40°C to +85°C, V_{CC} = 5.0V ± 5%;

C_{LOAD} = 50pF, R_{LOAD} = 500Ω unless otherwise noted.

Symbol	Parameter	Min. ⁽¹⁾	Typ.	Max.	Unit

t _{PHL}	AxBx to CxDx, CxDx to AxBx	—	—	—	—

t _{BX}	Switch Multiplex Delay ⁽²⁾	1.5	—	6.5	ns
	BX to Ax, Bx, Cx, Dx	—	—	—	—

NOTES:

- Minimums are guaranteed but not production tested.
- This parameter is guaranteed but not production tested.
- The bus switch contributes no propagation delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25ns for C_L = 50pF. Since this time constant is much smaller than the rise and fall times of typical driving signals, it adds very little propagation delay to the system. Propagation delay of the bus switch, when used in a system, is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
