Stereo-tone/volume control circuit

TDA1524A

GENERAL DESCRIPTION

The device is designed as an active stereo-tone/volume control for car radios, TV receivers and mains-fed equipment. It includes functions for bass and treble control, volume control with built-in contour (can be switched off) and balance. All these functions can be controlled by d.c. voltages or by single linear potentiometers.

Features

- Few external components necessary
- Low noise due to internal gain
- Bass emphasis can be increased by a double-pole low-pass filter
- Wide power supply voltage range.

QUICK REFERENCE DATA

Supply voltage (pin 3)	$V_P = V_{3-18}$	typ.	12	V
Supply current (pin 3)	$I_P = I_3$	typ.	35	mA
Maximum input signal with d.c. feedback (r.m.s. value)	$V_{i(rms)}$	typ.	2,5	V
Maximum output signal with d.c. feedback (r.m.s. value)	$V_{o(rms)}$	typ.	3	V
Volume control range	G_v		-80 to + 21,5	dB
Bass control range at 40 Hz	ΔG_v		-19 to + 17	dB
Treble control range at 16 kHz	ΔG_v	typ.	± 15	dB
Total harmonic distortion	THD	typ.	0,3	%
Output noise voltage (unweighted; r.m.s. value) at $f = 20$ Hz to 20 kHz; $V_P = 12$ V; for max. voltage gain	$V_{no(rms)}$	typ.	310	μV
for voltage gain $G_v = -40$ dB	$V_{no(rms)}$	typ.	100	μV
Channel separation at $G_v = -20$ to + 21,5 dB	α_{cs}	typ.	60	dB
Tracking between channels at $G_v = -20$ to + 26 dB	ΔG_v	max.	2,5	dB
Ripple rejection at 100 Hz	RR	typ.	50	dB
Supply voltage range (pin 3)	$V_P = V_{3-18}$		7,5 to 16,5	V
Operating ambient temperature range	T_{amb}		-30 to + 80	$^{\circ}C$

Notes to characteristics

- Equation for input resistance (see also Fig.4)

$$R_i = \frac{160\text{ k}\Omega}{1 + G_V}; G_{V_{\max}} = 12$$

- Frequencies below 200 Hz and above 5 kHz have reduced voltage swing, the reduction at 40 Hz and at 16 kHz is 30%.
- In the event of bass boosting the output signal handling is reduced. The reduction is 1 dB for maximum bass boost.
- Linear frequency response.
- For peak values add 4,5 dB to r.m.s. values.

SOLDERING**Introduction**

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

Soldering by dipping or by wave

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ($T_{stg\ max}$). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

Repairing soldered joints

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.
