

## 13-Bit Differential Input, Low Power A/D Converter with SPI™ Serial Interface

### Features

- Full Differential Inputs
- MCP3302: 2 Differential or 4 Single ended Inputs
- MCP3304: 4 Differential or 8 Single ended Inputs
- $\pm 1$  LSB max DNL
- $\pm 1$  LSB max INL (MCP3302/04-B)
- $\pm 2$  LSB max INL (MCP3302/04-C)
- Single supply operation: 2.7V to 5.5V
- 100 ksp/s sampling rate with 5V supply voltage
- 50 ksp/s sampling rate with 2.7V supply voltage
- 50 nA typical standby current, 1  $\mu$ A max
- 450  $\mu$ A max active current at 5V
- Industrial temp range:  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$
- 14 and 16-pin PDIP, SOIC, and TSSOP packages
- MXDEV™ Evaluation kit available

### Applications

- Remote Sensors
- Battery Operated Systems
- Transducer Interface

### Description

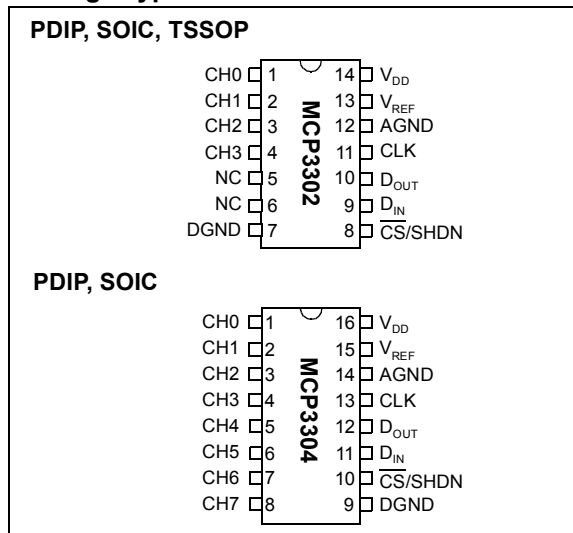

The Microchip Technology Inc. MCP3302/04 13-bit A/D converters feature full differential inputs and low power consumption in a small package that is ideal for battery powered systems and remote data acquisition applications. The MCP3302 is programmable to provide two differential input pairs or four single ended inputs. The MCP3304 is programmable and provides four differential input pairs or eight single ended inputs.

Incorporating a successive approximation architecture with on-board sample and hold circuitry, these 13-bit A/D converters are specified to have  $\pm 1$  LSB Differential Nonlinearity (DNL), and  $\pm 1$  LSB Integral Nonlinearity (INL) for B-grade and  $\pm 2$  LSB for C-grade devices. The industry-standard SPI™ serial interface enables 13-bit A/D converter capability to be added to any PIC-micro® microcontroller.

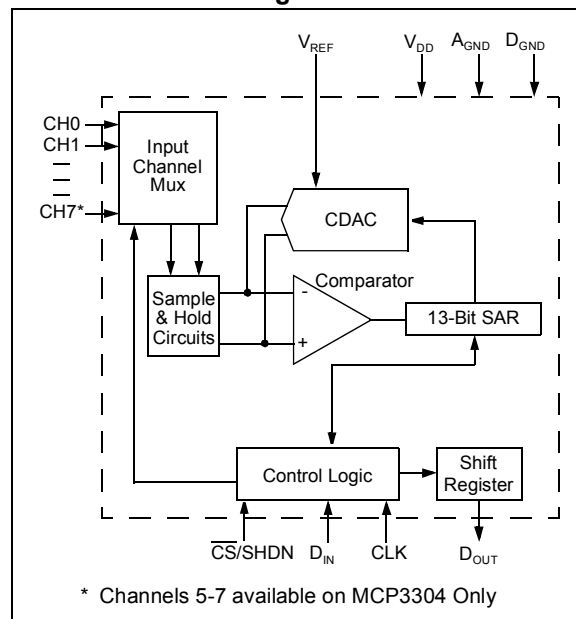

The MCP3302/04 devices feature low current design that permits operation with typical standby and active currents of only 50 nA and 300  $\mu$ A, respectively. The devices operate over a broad voltage range of 2.7V to 5.5V and are capable of conversion rates of up to 100 ksp/s. The reference voltage can be varied from 400 mV to 5V, yielding input-referred resolution between 98  $\mu$ V and 1.22 mV.

The MCP3302 is available in 14-pin PDIP, 150 mil SOIC, and TSSOP packages. The MCP3304 is available in 16-pin PDIP and 150 mil SOIC packages. The full differential inputs of these devices enable a wide variety of signals to be used in applications such as remote data acquisition, portable instrumentation, and battery operated applications.

### Package Types

### Functional Block Diagram

# MCP3302/04

## 1.0 ELECTRICAL CHARACTERISTICS

### 1.1 Maximum Ratings\*

$V_{DD}$  .....7.0V  
 All inputs and outputs w.r.t.  $V_{SS}$  ..... -0.3V to  $V_{DD}$  +0.3V  
 Storage temperature ..... -65°C to +150°C  
 Ambient temp. with power applied ..... -65°C to +125°C  
 Maximum Junction Temperature ..... 150°C  
 ESD protection on all pins (HBM) ..... > 4 kV

**\*Notice:** Stresses above those listed under “Maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

## PIN FUNCTION TABLE

NAME	FUNCTION
CH0-CH7	Analog Inputs
DGND	Digital Ground
CS/SHDN	Chip Select / Shutdown Input
D <sub>IN</sub>	Serial Data In
D <sub>OUT</sub>	Serial Data Out
CLK	Serial Clock
AGND	Analog Ground
V <sub>REF</sub>	Reference Voltage Input
V <sub>DD</sub>	+2.7V to 5.5V Power Supply

## ELECTRICAL CHARACTERISTICS

Unless otherwise noted, all parameters apply at  $V_{DD} = 5V$ ,  $V_{SS} = 0V$ , and  $V_{REF} = 5V$ . Full differential input configuration (Figure 3-4) with fixed common mode voltage of 2.5V. All parameters apply over temperature with  $T_{AMB} = -40^{\circ}C$  to  $+85^{\circ}C$  (**Note 7**). Conversion speed ( $f_{SAMPLE}$ ) is 100 ksp/s with  $f_{CLK} = 21 * f_{SAMPLE}$ .

Parameter	Sym	Min	Typ	Max	Units	Conditions
<b>Conversion Rate:</b>						
Maximum Sampling Frequency	$f_{SAMPLE}$	—	—	100	ksp/s	$V_{DD} = V_{REF} = 2.7V, V_{CM} = 1.35V$

## 4.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 4-1.

Name	Function
CH0-CH7	Analog Inputs
DGND	Digital Ground
CS/SHDN	Chip Select / Shutdown Input
D <sub>IN</sub>	Serial Data In
D <sub>OUT</sub>	Serial Data Out
CLK	Serial Clock
AGND	Analog Ground
V <sub>REF</sub>	Reference Voltage Input
V <sub>DD</sub>	+2.7V to 5.5V Power Supply

**TABLE 4-1:** Pin Function Table.

### 4.1 CH0-CH7

Analog input channels. These pins have an absolute voltage range of V<sub>SS</sub>-0.3V to V<sub>DD</sub>+0.3V. The full scale differential input range is defined as the absolute value of (IN+) - (IN-). This difference can not exceed the value of V<sub>REF</sub> - 1 LSB or digital code saturation will occur.

### 4.2 DGND

Ground connection to internal digital circuitry. To ensure accuracy this pin must be connected to the same ground as AGND. If an analog ground plane is available it is recommended that this device be tied to the analog ground plane in the circuit. See Section 6.6 for more information regarding circuit layout.

### 4.3 Chip Select/Shutdown (CS/SHDN)

The  $\overline{\text{CS/SHDN}}$  pin is used to initiate communication with the device when pulled low. This pin will end a conversion and put the device in low power standby when pulled high. The CS/SHDN pin must be pulled high between conversions and cannot be tied low for multiple conversions. See Figure 7-2 for serial communication protocol.

### 4.4 Serial Data Input (DIN)

The SPI port serial data input pin is used to clock in input channel configuration data. Data is latched on the rising edge of the clock. See Figure 7-2 for serial communication protocol.

### 4.5 Serial Data Output (DOUT)

The SPI serial data output pin is used to shift out the results of the A/D conversion. Data will always change on the falling edge of each clock as the conversion takes place. See Figure 7-2 for serial communication protocol.

### 4.6 Serial Clock (CLK)

The SPI clock pin is used to initiate a conversion and to clock out each bit of the conversion as it takes place. See Section 6.2 for constraints on clock speed. See Figure 7-2 for serial communication protocol.

### 4.7 AGND

Ground connection to internal analog circuitry. To ensure accuracy this pin must be connected to the same ground as DGND. If an analog ground plane is available it is recommended that this device be tied to the analog ground plane in the circuit. See Section 6.6 for more information regarding circuit layout.

### 4.8 Voltage Reference (VREF)

This input pin provides the reference voltage for the device, which determines the maximum range of the analog input signal and the LSB size.

The LSB size is determined according to the equation shown below. As the reference input is reduced, the LSB size is reduced accordingly.

$$LSB\ Size = \frac{2 \cdot V_{REF}}{8192}$$

When using an external voltage reference device, the system designer should always refer to the manufacturer's recommendations for circuit layout. Any instability in the operation of the reference device will have a direct effect on the accuracy of the ADC conversion results.

### 4.9 VDD

The voltage on this pin can range from 2.7 to 5.5V. To ensure accuracy a 0.1 μF ceramic bypass capacitor should be placed as close as possible to the pin. See Section 6.6 for more information regarding circuit layout.

## 5.0 DEFINITION OF TERMS

**Bipolar Operation** - This applies to either a differential or single ended input configuration where both positive and negative codes are output from the A/D converter. Full bipolar range includes all 8192 codes. For bipolar operation on a single ended input signal, the A/D converter must be configured to operate in pseudo differential mode.

**Unipolar Operation** - This applies to either a single ended or differential input signal where only one side of the device transfer is being used. This could be either the positive or negative side depending on the which input (IN+ or IN-) is being used for the DC bias. Full unipolar operation is equivalent to a 12-bit converter.

**Full Differential Input** - Applying a full differential signal to both the IN(+) and IN(-) inputs is referred to as full differential operation. This configuration is described in Figure 3-4.

**Pseudo-Differential Input** - Applying a single ended signal to only one of the input channels with a bipolar output is referred to as pseudo differential operation. To obtain a bipolar output from a single ended input signal the inverting input of the A/D converter must be biased above  $V_{SS}$ . This operation is described in Figure 3-5.

**Integral Nonlinearity** - The maximum deviation from a straight line passing through the endpoints of the bipolar transfer function is defined as the maximum integral nonlinearity error. The endpoints of the transfer function are a point 1/2 LSB above the first code transition (0x1000), and 1/2 LSB below the last code transition (0x0FFF).

**Differential Nonlinearity** - The difference between two measured adjacent code transitions and the 1 LSB ideal is defined as differential nonlinearity.

**Positive Gain Error** - This is the deviation between the last positive code transition (0x0FFF) and the ideal voltage level of  $V_{REF}/2$  LSB, after the bipolar offset error has been adjusted out.

**Negative Gain Error** - This is the deviation between the last negative code transition (0x1000) and the ideal voltage level of  $-V_{REF}/2$  LSB, after the bipolar offset error has been adjusted out.

**Offset Error** - This is the deviation between the first positive code transition (0x0001) and the ideal 1/2 LSB voltage level.

**Acquisition Time** - The acquisition time is defined as the time during which the internal sample capacitor is charging. This occurs for 1.5 clock cycles of the external CLK as defined in Figure 7-2.

**Conversion Time** - The conversion time occurs immediately after the acquisition time. During this time successive approximation of the input signal occurs as the 13-bit result is being calculated by the internal circuitry. This occurs for 13 clock cycles of the external CLK as defined in Figure 7-2.

**Signal to Noise Ratio** - Signal to Noise Ratio (SNR) is defined as the ratio of the signal to noise measured at the output of the converter. The signal is defined as the rms amplitude of the fundamental frequency of the input signal. The noise value is dependant on the device noise as well as the quantization error of the converter and is directly affected by the number of bits in the converter. The *theoretical* signal to noise ratio limit based on quantization error only for an N-bit converter is defined as:

$$SNR = (6.02N + 1.76)dB$$

For a 13-bit converter, the theoretical SNR limit is 80.02 dB.

**Total Harmonic Distortion** - Total Harmonic Distortion (THD) is the ratio of the rms sum of the harmonics to the fundamental, measured at the output of the converter. For the MCP3302/04, it is defined using the first 9 harmonics:

$$THD(-dB) = -20 \log \frac{\sqrt{V_2^2 + V_3^2 + V_4^2 + \dots + V_8^2 + V_9^2}}{V_1^2}$$

Here  $V_1$  is the rms amplitude of the fundamental, and  $V_2$  through  $V_9$  are the rms amplitudes of the second through ninth harmonics.

**Signal to Noise plus Distortion (SINAD)** - Numerically defined, SINAD is the calculated combination of SNR and THD. This number represents the dynamic performance of the converter including any harmonic distortion.

$$SINAD(dB) = 20 \log \sqrt{10^{(SNR/10)} + 10^{-(THD/10)}}$$

**Effective Number of Bits** - Effective number of bits (ENOB) states the relative performance of the ADC in terms of its resolution. This term is directly related to SINAD by the following equation:

$$ENOB(N) = \frac{SINAD - 1.76}{6.02}$$

For SINAD performance of 78 dB the effective number of bits is 12.66.

**Spurious Free Dynamic Range** - Spurious Free Dynamic Range (SFDR) is the ratio of the rms value of the fundamental to the next largest component in ADC's output spectrum. This is typically the first harmonic, but could also be a noise peak.

## 6.0 APPLICATIONS INFORMATION

### 6.1 Conversion Description

The MCP3302/04 A/D converters employ a conventional SAR architecture. With this architecture, the potential between the IN+ and IN- inputs are simultaneously sampled and stored with the internal sample circuits for 1.5 clock cycles. Following this sampling time, the input hold switches of the converter open and the device uses the collected charge to produce a serial 13-bit binary two's complement output code. This conversion process is driven by the external clock and must include 13 clock cycles, one for each bit. During this process, the most significant bit (MSB) is output first. This bit is the sign bit and indicates if the IN+ or IN- input is at a higher potential.

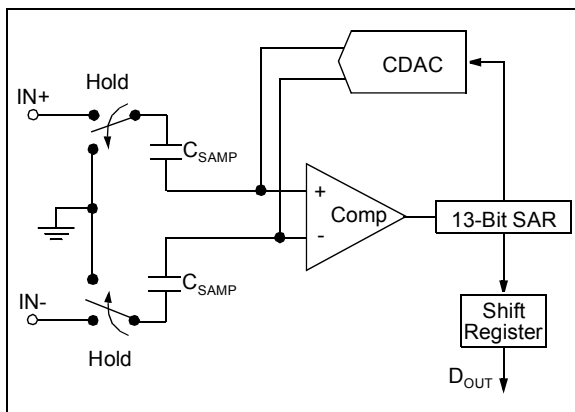

FIGURE 6-1: Simplified Block Diagram.

### 6.2 Driving the Analog Input

The analog input of the MCP3302/04 is easily driven either differentially or single ended. Any signal that is common to the two input channels will be rejected by the common mode rejection of the device. During the charging time of the sample capacitor, a small charging current will be required. For low source impedances, this input can be driven directly. For larger source impedances, a larger acquisition time will be required due to the RC time constant that includes the source impedance. For the A/D Converter to meet specification, the charge holding capacitor ( $C_{SAMPLE}$ ) must be given enough time to acquire a 13-bit accurate voltage level during the 1.5 clock cycle acquisition period.

An analog input model is shown in Figure 6-2. This model is accurate for an analog input, regardless if it is configured as a single ended input, or the IN+ and IN- input in differential mode. In this diagram, it is shown that the source impedance ( $R_S$ ) adds to the internal sampling switch ( $R_{SS}$ ) impedance, directly affecting the time that is required to charge the capacitor ( $C_{SAMPLE}$ ). Consequently, a larger source impedance with no additional acquisition time increases the offset, gain, and integral linearity errors of the conversion. To overcome this a slower clock speed can be used to allow for the longer charging time. Figure 6-3 shows the maximum clock speed associated with source impedances.

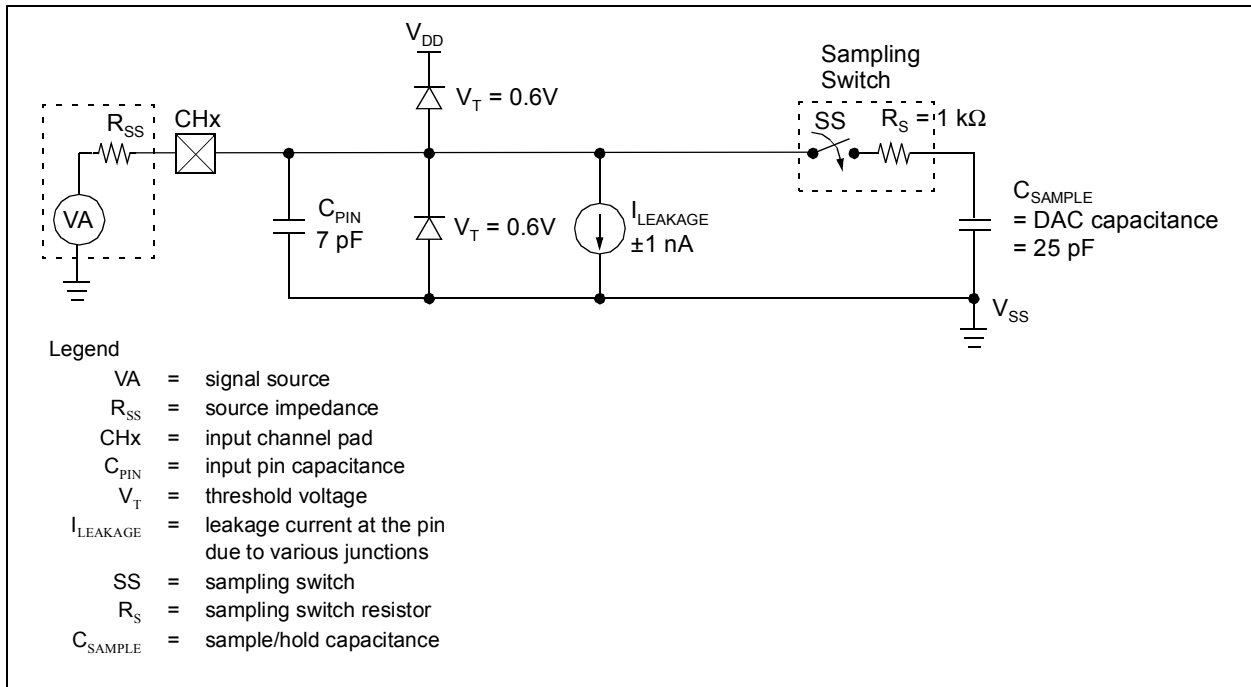

FIGURE 6-2: Analog Input Model.

# MCP3302/04

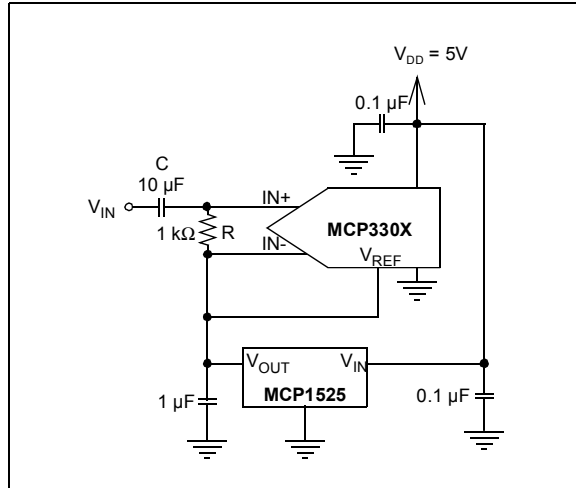

**FIGURE 6-3:** Maximum Clock Frequency vs. Source Resistance ( $R_S$ ) to maintain  $\pm 1$  LSB INL.

## 6.2.1 MAINTAINING MINIMUM CLOCK SPEED

When the MCP3302/04 initiates, charge is stored on the sample capacitor. When the sample period is complete, the device converts one bit for each clock that is received. It is important for the user to note that a slow clock rate will allow charge to bleed off the sample cap while the conversion is taking place. At 85°C (worst case condition), the part will maintain proper charge on the sample capacitor for at least 1.2 ms after the sample period has ended. This means that the time between the end of the sample period and the time that all 13 data bits have been clocked out must not exceed 1.2 ms (effective clock frequency of 10 kHz). Failure to meet this criteria may induce linearity errors into the conversion outside the rated specifications. It should be noted that during the entire conversion cycle, the A/D converter does not have requirements for clock speed or duty cycle, as long as all timing specifications are met.

## 6.3 Biasing Solutions

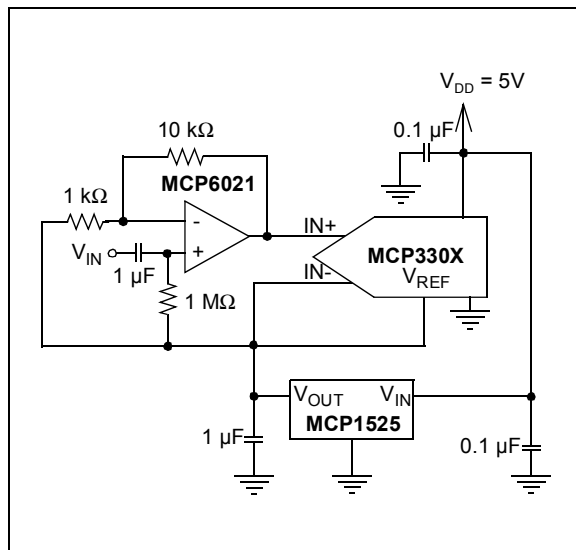

For pseudo-differential bipolar operation, the biasing circuit shown in Figure 6-4 shows a single ended input AC coupled to the converter. This configuration will give a digital output range of -4096 to +4095. With the 2.5V reference the LSB size is equal to 610  $\mu$ V.

**FIGURE 6-4:** Pseudo-differential biasing circuit for bipolar operation.

Although the ADC is not production tested with a 2.5V reference as shown, linearity will not change more than 0.1 LSB. See Figure 2-2 and 2-9 for DNL and INL errors versus  $V_{REF}$  at  $V_{DD} = 5V$ . A trade-off exists between the high pass corner and the acquisition time. The value of C will need to be quite large in order to bring down the high pass corner. The value of R will need to be 1 k $\Omega$ , or less, since higher input impedances require additional acquisition time. Using the RC values in Figure 6-4, we have a 100 Hz corner frequency. See Figure 2-12 for relation between input impedance and acquisition time.

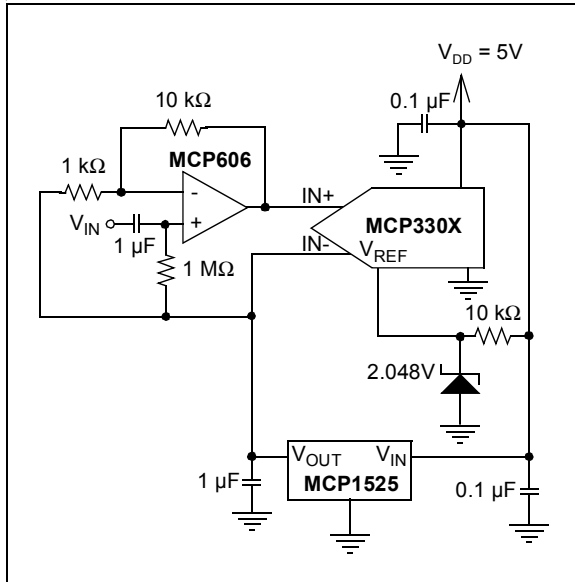

Using an external operation amplifier on the input allows for gain and also buffers the input signal from the input to the ADC allowing for a higher source impedance. This circuit is shown in Figure 6-5.

**FIGURE 6-5:** Adding an amplifier allows for gain and also buffers the input from any high impedance sources.

This circuit shows that some headroom will be lost due to the amplifier output not being able to swing all the way to the rail. An example would be for an output swing of 0V to 5V. This limitation can be overcome by supplying a  $V_{REF}$  that is slightly less than the common mode voltage. Using a 2.048V reference for the A/D converter while biasing the input signal at 2.5V solves the problem. This circuit is shown in Figure 6-5.

**FIGURE 6-6:** Circuit solution to overcome amplifier output swing limitation.

## 6.4 Common Mode Range

The common mode input range has no restriction and is equal to the absolute input voltage range:  $V_{SS} - 0.3V$  to  $V_{DD} + 0.3V$ . However, for a given  $V_{REF}$ , the common mode voltage has a limited swing, if the entire range of the A/D converter is to be used. Figure 6-7 and Figure 6-8 show the relationship between  $V_{REF}$  and the common mode voltage swing. A smaller  $V_{REF}$  allows for wider flexibility in a common mode voltage.  $V_{REF}$  levels down to 400 mV exhibit less than 0.1 LSB change in DNL and INL. Characterization graphs are provided that show this performance relationship, see Figure 2-9 and Figure 2-12.

**FIGURE 6-7:** Common Mode Range of Full Differential input signal versus  $V_{REF}$ .

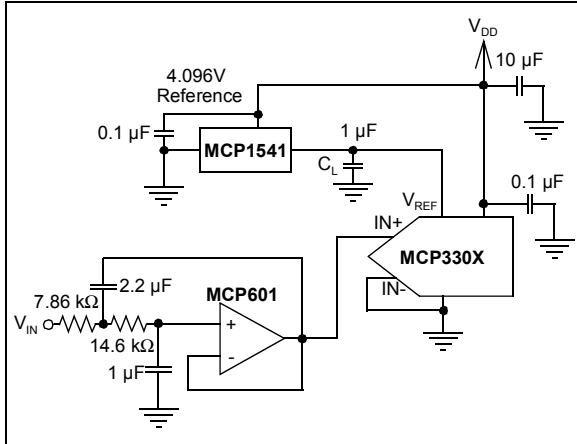

**FIGURE 6-8:** Common Mode Range versus  $V_{REF}$  for Pseudo Differential Input.

## 6.5 Buffering/Filtering the Analog Inputs

Inaccurate conversion results may occur if the signal source for the A/D converter is not a low impedance source. Buffering the input will overcome the impedance issue. It is also recommended that an analog filter be used to eliminate any signals that may be aliased back into the conversion results. This is illustrated in Figure 6-9 where an op amp is used to drive the analog input of the MCP3302/04. This amplifier provides a low impedance source for the converter input and a low pass filter, which eliminates unwanted high frequency noise. Values shown are for a 10 Hz Butterworth Low Pass filter.

Low pass (anti-aliasing) filters can be designed using Microchip's interactive FilterLab™ software. FilterLab will calculate capacitor and resistor values, as well as determine the number of poles that are required for the application. For more information on filtering signals, see the application note AN699 "Anti-Aliasing Analog Filters for Data Acquisition Systems."

# MCP3302/04

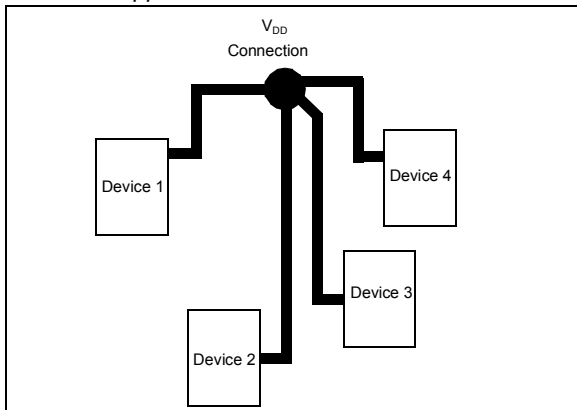

**FIGURE 6-9:** The MCP601 Operational Amplifier is used to implement a 2nd order anti-aliasing filter for the signal being converted by the MCP3302/04.

## 6.6 Layout Considerations

When laying out a printed circuit board for use with analog components, care should be taken to reduce noise wherever possible. A bypass capacitor from  $V_{DD}$  to ground should always be used with this device and should be placed as close as possible to the device pin. A bypass capacitor value of 0.1  $\mu\text{F}$  is recommended.

Digital and analog traces should be separated as much as possible on the board and no traces should run underneath the device or the bypass capacitor. Extra precautions should be taken to keep traces with high frequency signals (such as clock lines) as far as possible from analog traces.

Use of an analog ground plane is recommended in order to keep the ground potential the same for all devices on the board. Providing  $V_{DD}$  connections to devices in a “star” configuration can also reduce noise by eliminating current return paths and associated errors. See Figure 6-10. For more information on layout tips when using the MCP3302/04 or other ADC devices, refer to AN-688 “Layout Tips for 12-Bit A/D Converter Applications”.

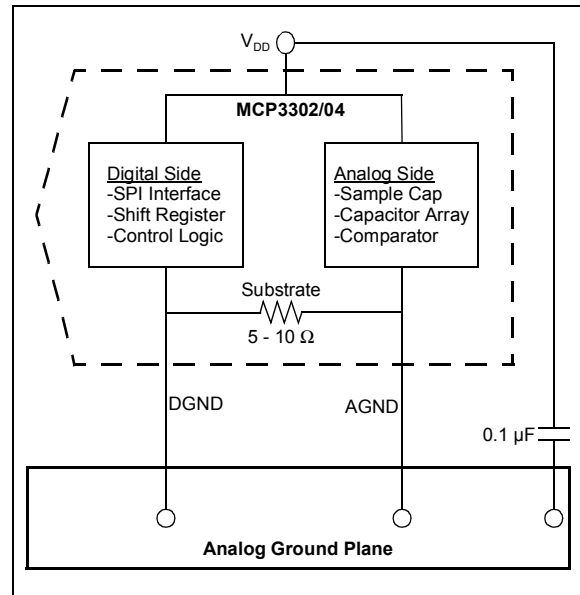

**FIGURE 6-10:**  $V_{DD}$  traces arranged in a ‘Star’ configuration in order to reduce errors caused by current return paths.

## 6.7 Utilizing the Digital and Analog Ground Pins

The MCP3302/04 devices provide both digital and analog ground connections to provide another means of noise reduction. As shown in Figure 6-11, the analog and digital circuitry are separated internal to the device. This reduces noise from the digital portion of the device being coupled into the analog portion of the device. The two grounds are connected internally through the substrate which has a resistance of 5 - 10  $\Omega$ .

If no ground plane is utilized, then both grounds must be connected to  $V_{SS}$  on the board. If a ground plane is available, both digital and analog ground pins should be connected to the analog ground plane. If both an analog and a digital ground plane are available, both the digital and the analog ground pins should be connected to the analog ground plane as shown in Figure 6-11. Following these steps will reduce the amount of digital noise from the rest of the board being coupled into the A/D Converter.

**FIGURE 6-11:** Separation of Analog and Digital Ground Pins.

## 7.0 SERIAL COMMUNICATIONS

### 7.1 Output Code Format

The output code format is a binary two's complement scheme with a leading sign bit that indicates the sign of the output. If the IN+ input is higher than the IN- input, the sign bit will be a zero. If the IN- input is higher, the sign bit will be a '1'.

The diagram shown in Figure 7-1 shows the output code transfer function. In this diagram, the horizontal axis is the analog input voltage and the vertical axis is the output code of the ADC. It shows that when IN+ is equal to IN-, both the sign bit and the data word is zero. As IN+ gets larger with respect to IN-, then the sign bit is a zero and the data word gets larger. The full scale output code is reached at +4095 when the input [(IN+) - (IN-)] reaches  $V_{REF} - 1 \text{ LSB}$ . When IN- is larger than IN+, the two's complement output codes will be seen with the sign bit being a one. Some examples of analog input levels and corresponding output codes are shown in Table 7-1

Analog Input Levels	Sign Bit	Binary Data	Decimal DATA
Full Scale Positive (IN+)-(IN-)= $V_{REF}-1 \text{ LSB}$	0	1111 1111 1111	+4095
(IN+)-(IN-) = $V_{REF}-2 \text{ LSB}$	0	1111 1111 1110	+4094
IN+ = (IN-) +2 LSB	0	0000 0000 0010	+2
IN+ = (IN-) +1 LSB	0	0000 0000 0001	+1
IN+ = IN-	0	0000 0000 0000	0
IN+ = (IN-) - 1 LSB	1	1111 1111 1111	-1
IN+ = (IN-) - 2 LSB	1	1111 1111 1110	-2
(IN+)-(IN-) = $V_{REF}-2 \text{ LSB}$	1	0000 0000 0001	-4095
Full Scale Negative (IN+)-(IN-) = $V_{REF}-1 \text{ LSB}$	1	0000 0000 0000	-4096

**FIGURE 7-1:** Output Code Transfer Function.

# MCP3302/04

## 7.2 Communicating with the MCP3302 and MCP3304

Communication with the MCP3302/04 devices is done using a standard SPI-compatible serial interface. Initiating communication with either device is done by bringing the  $\overline{CS}$  line low. See Figure 7-2. If the device was powered up with the  $\overline{CS}$  pin low, it must be brought high and back low to initiate communication. The first clock received with  $\overline{CS}$  low and  $D_{IN}$  high will constitute a start bit. The SGL/DIFF bit follows the start bit and will determine if the conversion will be done using single ended or differential input mode. Each channel in single ended mode will operate as a 12-bit converter with a unipolar output. No negative codes will be output in single ended mode. The next three bits (D0, D1 and D2) are used to select the input channel configuration. Table 7-2 and Table 7-3 show the configuration bits for the MCP3302 and MCP3304, respectively. The device will begin to sample the analog input on the fourth rising edge of the clock after the start bit has been received. The sample period will end on the falling edge of the fifth clock following the start bit.

After the D0 bit is input, one more clock is required to complete the sample and hold period ( $D_{IN}$  is a don't care for this clock). On the falling edge of the next clock, the device will output a low null bit. The next 13 clocks will output the result of the conversion with the sign bit first, followed by the 12 remaining data bits, as shown in Figure 7-2. Note that if the device is operating in the single-ended mode, the sign bit will always be transmitted as a 0. Data is always output from the device on the falling edge of the clock. If all 13 data bits have been transmitted and the device continues to receive clocks while the  $\overline{CS}$  is held low, the device will output the conversion result LSB first as shown in Figure 7-3. If more clocks are provided to the device while  $\overline{CS}$  is still low (after the LSB first data has been transmitted), the device will clock out zeros indefinitely.

If necessary, it is possible to bring  $\overline{CS}$  low and clock in leading zeros on the  $D_{IN}$  line before the start bit. This is often done when dealing with microcontroller-based SPI ports that must send 8 bits at a time. Refer to Section 7.3 for more details on using the MCP3302/04 devices with hardware SPI ports

## 7.3 Using the MCP3302/04 with Microcontroller (MCU) SPI Ports

With most microcontroller SPI ports, it is required to send groups of eight bits. It is also required that the microcontroller SPI port be configured to clock out data on the falling edge of clock and latch data in on the rising edge. Because communication with the MCP3302/04 devices may not need multiples of eight clocks, it will be necessary to provide more clocks than are required. This is usually done by sending 'leading zeros' before the start bit. As an example, Figure 7-4 and Figure 7-5 shows how the MCP3302/04 devices can be interfaced to a MCU with a hardware SPI port. Figure 7-4 depicts the operation shown in SPI Mode 0,0 which requires that the SCLK from the MCU idles in the 'low' state, while Figure 7-5 shows the similar case of SPI Mode 1,1 where the clock idles in the 'high' state.

As shown in Figure 7-4, the first byte transmitted to the A/D Converter contains 6 leading zeros before the start

bit. Arranging the leading zeros this way produces the 13 data bits to fall in positions easily manipulated by the MCU. The sign bit is clocked out of the A/D Converter on the falling edge of clock number 11, followed by the remaining data bits (MSB first). After the second eight clocks have been sent to the device, the MCU receive buffer will contain 2 unknown bits (the output is at high impedance for the first two clocks), the null bit, the sign bit and the 4 highest order bits of the conversion. After the third byte has been sent to the device, the receive register will contain the lowest order eight bits of the conversion results. Easier manipulation of the converted data can be obtained by using this method.

Figure 7-5 shows the same situation in SPI Mode 1,1 which requires that the clock idles in the high state. As with mode 0,0, the A/D Converter outputs data on the falling edge of the clock and the MCU latches data from the A/D Converter in on the rising edge of the clock.

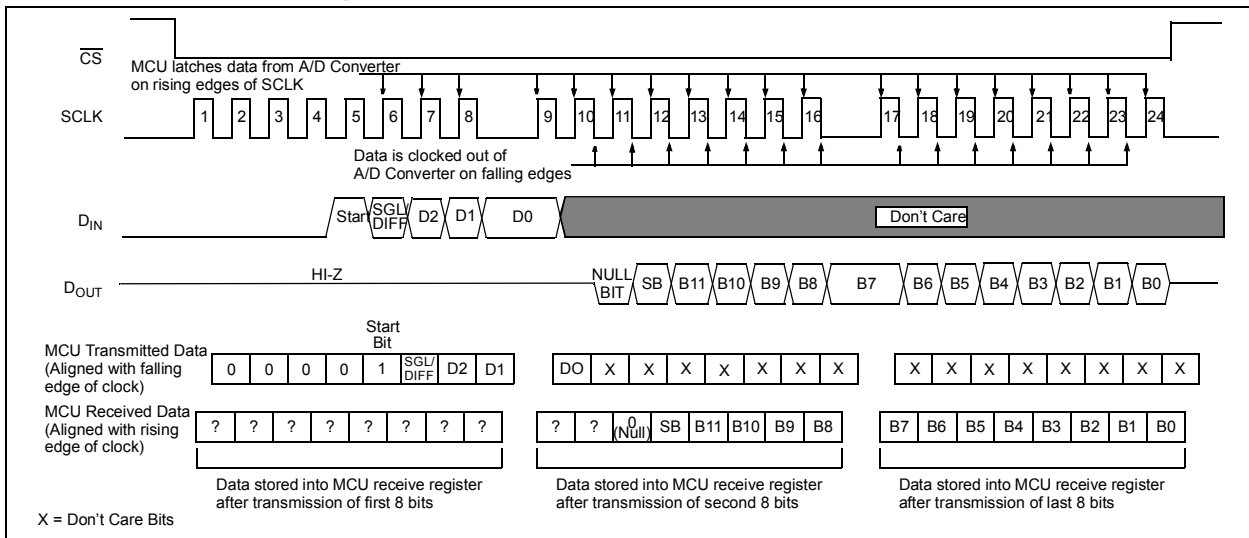

FIGURE 7-4: SPI Communication with the MCP3302/04 using 8-bit segments (Mode 0,0: SCLK idles low).

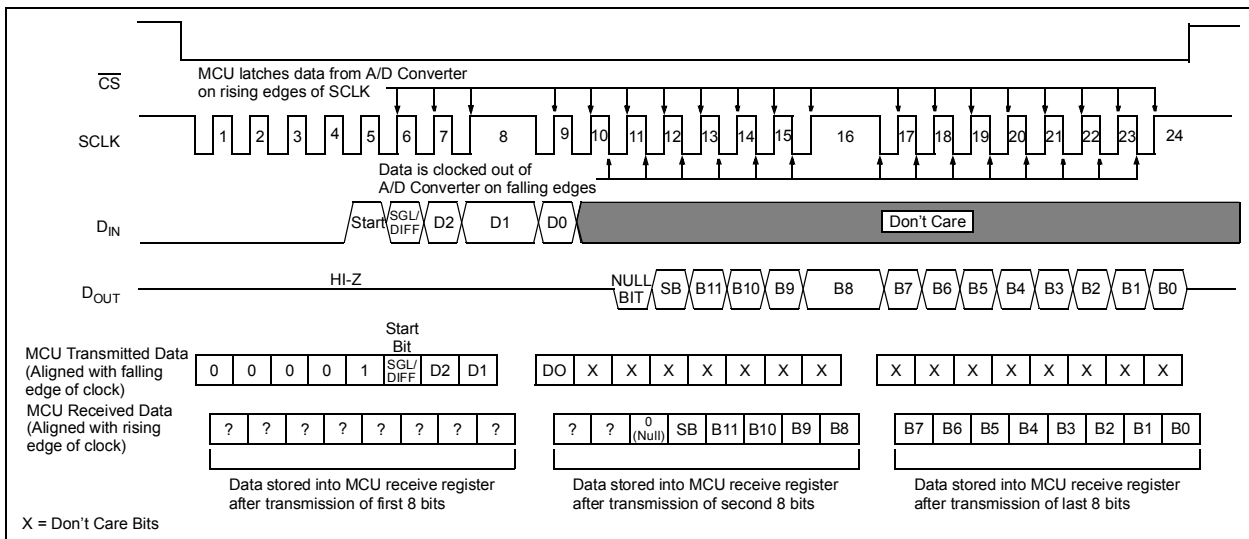

FIGURE 7-5: SPI Communication with the MCP3302/04 using 8-bit segments (Mode 1,1: SCLK idles high).

## 8.0 PACKAGING INFORMATION

### 8.1 Package Marking Information

14-Lead PDIP (300 mil)

Example:

14-Lead SOIC (150 mil)

Example:

14-Lead TSSOP (4.4mm) \*

Example:

\* Please contact Microchip Factory for B-Grade TSSOP devices

<b>Legend:</b>	XX...X	Customer specific information*
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
<b>Note:</b> In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line thus limiting the number of available characters for customer specific information.		

\* Standard marking consists of Microchip part number, year code, week code, traceability code (facility code, mask rev#, and assembly code). For marking beyond this, certain price adders apply. Please check with your Microchip Sales Office.

# MCP3302/04

## Package Marking Information (Continued)

16-Lead PDIP (300 mil) (MCP3304)

Example:

16-Lead SOIC (150 mil) (MCP3304)

Example:

<b>Legend:</b>	XX...X	Customer specific information*
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
<b>Note:</b> In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line thus limiting the number of available characters for customer specific information.		

\* Standard marking consists of Microchip part number, year code, week code, traceability code (facility code, mask rev#, and assembly code). For marking beyond this, certain price adders apply. Please check with your Microchip Sales Office.

NOTES:

## ON-LINE SUPPORT

Microchip provides on-line support on the Microchip World Wide Web (WWW) site.

The web site is used by Microchip as a means to make files and information easily available to customers. To view the site, the user must have access to the Internet and a web browser, such as Netscape or Microsoft Explorer. Files are also available for FTP download from our FTP site.

### Connecting to the Microchip Internet Web Site

The Microchip web site is available by using your favorite Internet browser to attach to:

**[www.microchip.com](http://www.microchip.com)**

The file transfer site is available by using an FTP service to connect to:

**<ftp://ftp.microchip.com>**

The web site and file transfer site provide a variety of services. Users may download files for the latest Development Tools, Data Sheets, Application Notes, User's Guides, Articles and Sample Programs. A variety of Microchip specific business information is also available, including listings of Microchip sales offices, distributors and factory representatives. Other data available for consideration is:

- Latest Microchip Press Releases
- Technical Support Section with Frequently Asked Questions
- Design Tips
- Device Errata
- Job Postings
- Microchip Consultant Program Member Listing
- Links to other useful web sites related to Microchip Products
- Conferences for products, Development Systems, technical information and more
- Listing of seminars and events

## Systems Information and Upgrade Hot Line

The Systems Information and Upgrade Line provides system users a listing of the latest versions of all of Microchip's development systems software products. Plus, this line provides information on how customers can receive any currently available upgrade kits. The Hot Line Numbers are:

1-800-755-2345 for U.S. and most of Canada, and

1-480-792-7302 for the rest of the world.

013001

## READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this Data Sheet.

To: Technical Publications Manager Total Pages Sent  
RE: Reader Response  
From: Name \_\_\_\_\_  
Company \_\_\_\_\_  
Address \_\_\_\_\_  
City / State / ZIP / Country \_\_\_\_\_  
Telephone: (\_\_\_\_\_) \_\_\_\_\_ - \_\_\_\_\_ FAX: (\_\_\_\_\_) \_\_\_\_\_ - \_\_\_\_\_

Application (optional):

Would you like a reply? \_\_\_Y \_\_\_N

Device: **MCP3302/04** Literature Number: **DS21697A**

Questions:

1. What are the best features of this document?

---

---

2. How does this document meet your hardware and software development needs?

---

---

3. Do you find the organization of this data sheet easy to follow? If not, why?

---

---

4. What additions to the data sheet do you think would enhance the structure and subject?

---

---

5. What deletions from the data sheet could be made without affecting the overall usefulness?

---

---

6. Is there any incorrect or misleading information (what and where)?

---

---

7. How would you improve this document?

---

---

8. How would you improve our software, systems, and silicon products?

---

---

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

<u>PART NO.</u>	<u>X</u>	<u>/XX</u>
Device	Temperature Range	Package
Device:	MCP3302: 13-Bit Serial A/D Converter MCP3302T: 13-Bit Serial A/D Converter (Tape and Reel) MCP3304: 13-Bit Serial A/D Converter MCP3304T: 13-Bit Serial A/D Converter (Tape and Reel)	
Temperature Range:	I = -40°C to +85°C	
Package:	P = Plastic DIP (300 mil Body), 14-lead, 16-lead SL = Plastic SOIC (150 mil Body), 14-lead, 16-lead ST = Plastic TSSOP (4.4mm), 14-lead	

**Examples:**

- a) MCP3302-I/P: Industrial Temperature, PDIP package
- b) MCP3302-I/SN: Industrial Temperature, SOIC package
- c) MCP3302-I/ST: Industrial Temperature, SOIC package
  
- a) MCP3304-I/P: Industrial Temperature, PDIP package
- b) MCP3304-I/SN: Industrial Temperature, SOIC package
- c) MCP3304-I/ST: Industrial Temperature, SOIC package

## Sales and Support

### Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site ([www.microchip.com](http://www.microchip.com))

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

### New Customer Notification System

Register on our web site ([www.microchip.com/cn](http://www.microchip.com/cn)) to receive the most current information on our products.
