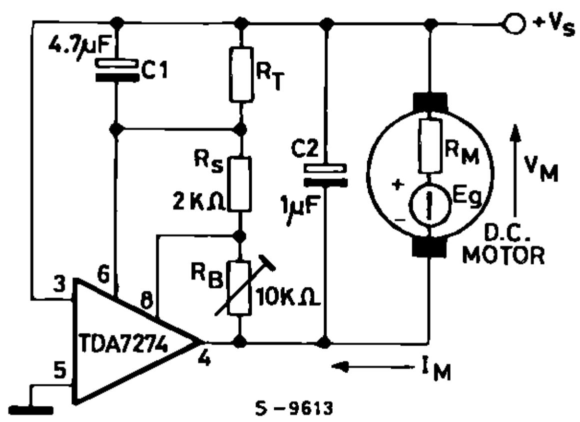
APPLICATION INFORMATION

Figure 16.



I_M = Motor current at rated speed
R_M = Motor resistance
E_g = Back electromotive force
$V_M = I_M . R_M + E_g$

$$E_g = R_T\, I_d + I_M \left(\frac{R_T}{K} - R_M \right) + V_{ref}$$

$$\left[1 + \frac{R_B}{R_S} + \frac{R_T}{R_S} (1 + \frac{1}{K}) \right]$$

R_S has to be adjusted so that the applied voltage V_M is suitable for a given motor, the speed is then linearly adjustable varing R_B.

The value of R_T is calculated so that

$$R_{T\,(max.)} < K_{(min.)} \bullet R_{M\,(min.)}$$

If $R_{T\,(max.)} > K \bullet R_M$, instability may occur.

The values of C_1 (4.7 µF typ.) and C_2 (1 µF typ.) depend on the type of motor used. C_1 adjusts WOW and flutter of the system. C_2 suppresses motor spikes.
