**Philips Semiconductors**

**PHILIPS**

**4 × 4 video switch matrix****TDA8540****FEATURES**

- I<sup>2</sup>C-bus or non-I<sup>2</sup>C-bus mode (controlled by DC voltages)
- S-VHS or CVBS processing
- 3-state switches for all channels
- Selectable gain for the video channels
- sub-address facility
- Slave receiver in the I<sup>2</sup>C mode
- Auxiliary logic outputs for audio switching
- System expansion possible up to 7 devices (28 sources)
- Static short-circuit proof outputs
- ESD protection.

**GENERAL DESCRIPTION**

The TDA8540 has been designed for switching between composite video signals, therefore the minimum of four input lines are provided as requested for switching between two S-VHS sources. Each of the four outputs can be set to a high impedance state, to enable parallel connection of several devices.

**APPLICATIONS**

- Colour Television (CTV) receivers
- Peritelevision sets
- Satellite receivers.

**QUICK REFERENCE DATA**

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT

## 4 × 4 video switch matrix

## TDA8540

**FUNCTIONAL DESCRIPTION**

The TDA8540 is controlled via a bidirectional I<sup>2</sup>C-bus. 3 bits of the I<sup>2</sup>C address can be selected via the address pin, thus providing a facility for parallel connection of 7 devices.

Control options via the I<sup>2</sup>C-bus:

- The input signals can be clamped at their negative peak (top sync).
- The gain factor of the outputs can be selected between 1× or 2×.
- Each of the four outputs can individually be connected to one of the four inputs.
- Each output can individually be set in a high impedance state.
- Two binary output data lines can be controlled for switching accompanying sound signals.

The SDA and SCL pins (pins 19 and 18) can be connected to the I<sup>2</sup>C-bus or to DC switching voltage sources. Address inputs S0 to S2 (pins 11, 7 and 5) are used to select sub-addresses or switching to the non-I<sup>2</sup>C mode. Inputs S0 to S2 can be connected to the supply voltage (HIGH) or the ground (LOW). In this way no peripheral components are required for selection.

**Table 1** I<sup>2</sup>C-bus sub-addressing

S2	S1	S0	SUB-ADDRESS		
			A2	A1	A0
L	L	L	0	0	0
L	L	H	0	0	1
L	H	L	0	1	0
L	H	H	0	1	1
H	L	L	1	0	0
H	L	H	1	0	1
H	H	L	1	1	0
H	H	H	non I <sup>2</sup> C addressable		

**I<sup>2</sup>C-bus control**

After power-up the outputs are initialized in the high impedance state, and D0 and D1 are at a LOW level.

Detailed description of the I<sup>2</sup>C-bus specification, with applications, is given in brochure "The I<sup>2</sup>C-bus and how to use it". This brochure may be ordered using the code 9398 393 40011.

The TDA8540 is a **slave receiver** and the protocol is given in Table 2.

**Table 2** The TDA8540 protocol

SEQUENCE									
S <sup>(1)</sup>	SLV <sup>(2)</sup>	A <sup>(3)</sup>	SUB	A <sup>(3)</sup>	DATA	A <sup>(3)</sup>	DATA	A <sup>(3)</sup>	P <sup>(4)</sup>

**Notes**

1. S = START condition.
2. Data transmission to the TDA8540 starts with the slave address (SLV).
3. A = acknowledge bit, generated by TDA8540.
4. P = STOP condition.

**Table 3** Data transmission to the TDA8540 begins with SLV

A6 MSB	A5	A4	A3	A2	A1	A0	R/ $\overline{W}$ LSB
1	0	0	1	A2 <sup>(1)</sup>	A1 <sup>(1)</sup>	A0 <sup>(1)</sup>	0 <sup>(2)</sup>

**Notes**

1. A2 to A0: pin programmable slave address bits.
2. R/ $\overline{W}$  = 0; write only.

After the SLV, a second byte, SUB, is required for selecting the functions, as shown in Table 4.

## 4 × 4 video switch matrix

## TDA8540

**Table 4** The second byte: SUB

7 MSB	6	5	4	3	2	1	0 LSB
0	0	0	0	0	0	RS1	RS0

Options for SUB:

If SUB = 00H: access to switch control (SW1)

If SUB = 01H: access to gain/clamp/data control (GCO)

If SUB = 02H: access to output enable control (OEN).

**Remarks:**

If more than one data byte is sent, the SUB byte will be automatically incremented.

If more than 3 data bytes are sent, the internal counter will roll over and the device will then rewrite the first register.

**Data Bytes**

SWI (SUB = 00H): selects which input is connected to the different outputs, as shown in Table 5.

**Table 5** SWI (SUB = 00H) selection of inputs connected to outputs

7 MSB	6	5	4	3	2	1	0 LSB
S31	S30	S21	S20	S11	S10	S01	S00

**Table 6** Selection of inputs

OUTPUT	Sj1 AND Sj0 <sup>(1)</sup>			
	00	01	10	11
OUTj	IN0	IN1	IN2	IN3

**Note**

- For j = 0 to 3.  
Example: if S21 = 0 and S20 = 1, then OUT2 is connected to IN1.

GCO (SUB = 01H):

- Selects the gain of each output.
- Selects the clamp action or mean value on inputs 0 and 1.
- Determines the value of the auxiliary outputs D1 and D0.

**Table 7** GCO byte

7 MSB	6	5	4	3	2	1	0 LSB
G3 <sup>(1)</sup>	G2 <sup>(1)</sup>	G1 <sup>(1)</sup>	G0 <sup>(1)</sup>	CL1 <sup>(2)</sup>	CL0 <sup>(2)</sup>	D1 <sup>(3)</sup>	D0 <sup>(3)</sup>

**Notes**

- For j = 0 to 3: if Gj = 0 (1), then output j has a gain of 2 (1).
- If CL0 (CL1) = 0, then input signal on IN0 (IN1) is clamped.
- For j = 0 or 1: if Dj = 0 (1), then logical output j is LOW (HIGH).

## 4 × 4 video switch matrix

## TDA8540

OEN (SUB = 02H): selects, for each output, if the output is active or high impedance, see Table 8.

**Table 8** OEN (SUB = 02H) determines which output is active or high impedance

7 MSB	6	5	4	3	2	1	0 LSB
X <sup>(1)</sup>	X <sup>(1)</sup>	X <sup>(1)</sup>	X <sup>(1)</sup>	EN3 <sup>(2)</sup>	EN2 <sup>(2)</sup>	EN1 <sup>(2)</sup>	EN0 <sup>(2)</sup>

#### Notes

1. X = don't care.
2. For j = 0 to 3: if ENj = 0 (1), then OUT j is high impedance (active).

After a power-on reset:

- The outputs are set to a high impedance state; the outputs are connected to IN0; the gains are set at two and inputs IN0 and IN1 are clamped.
- Programming of the device is necessary because the outputs are in high impedance state.

#### Non-I<sup>2</sup>C-bus control

If the S0, S1 and S2 pins are all connected to V<sub>CC</sub> the device will enter the non-I<sup>2</sup>C-bus mode.

After a power-on reset:

- Gain is set at two for all outputs.
- All inputs are clamped.
- All outputs are active.
- The matrix position is given by the SDA and SCL voltage level.

**Table 9** Non-I<sup>2</sup>C-bus control

OUTPUT	SCL AND SDA			
	00	01	10	11
OUT3	IN3	IN2	IN1	IN0
OUT2	IN2	IN3	IN0	IN1
OUT1	IN1	IN0	IN3	IN2
OUT0	IN0	IN1	IN2	IN3

SCL and SDA act as normal input pins:

SCL interchanges (OUT3 and OUT2) with (OUT1 and OUT0).

SDA interchanges OUT3 with OUT2 and OUT1 with OUT0.

**Remark:** For use with chrominance signals, the clamp action must be overruled by external bias.

**SOLDERING****Plastic small outline packages**

## BY WAVE

During placement and before soldering, the component must be fixed with a droplet of adhesive. After curing the adhesive, the component can be soldered. The adhesive can be applied by screen printing, pin transfer or syringe dispensing.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder bath is 10 s, if allowed to cool to less than 150 °C within 6 s. Typical dwell time is 4 s at 250 °C.

A modified wave soldering technique is recommended using two solder waves (dual-wave), in which a turbulent wave with high upward pressure is followed by a smooth laminar wave. Using a mildly-activated flux eliminates the need for removal of corrosive residues in most applications.

## BY SOLDER PASTE REFLOW

Reflow soldering requires the solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the substrate by screen printing, stencilling or pressure-syringe dispensing before device placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt, infrared, and vapour-phase reflow. Dwell times vary between 50 and 300 s according to method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 min at 45 °C.

## REPAIRING SOLDERED JOINTS (BY HAND-HELD SOLDERING IRON OR PULSE-HEATED SOLDER TOOL)

Fix the component by first soldering two, diagonally opposite, end pins. Apply the heating tool to the flat part of the pin only. Contact time must be limited to 10 s at up to 300 °C. When using proper tools, all other pins can be soldered in one operation within 2 to 5 s at between 270 and 320 °C. (Pulse-heated soldering is not recommended for SO packages.)

For pulse-heated solder tool (resistance) soldering of VSO packages, solder is applied to the substrate by dipping or by an extra thick tin/lead plating before package placement.

**Plastic dual in-line packages**

## BY DIP OR WAVE

The maximum permissible temperature of the solder is 260 °C; this temperature must not be in contact with the joint for more than 5 s. The total contact time of successive solder waves must not exceed 5 s.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified storage maximum. If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

## REPAIRING SOLDERED JOINTS

Apply a low voltage soldering iron below the seating plane (or not more than 2 mm above it). If its temperature is below 300 °C, it must not be in contact for more than 10 s; if between 300 and 400 °C, for not more than 5 s.

**4 × 4 video switch matrix****TDA8540****DEFINITIONS**

<b>Data sheet status</b>	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
<b>Limiting values</b>	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
<b>Application information</b>	
Where application information is given, it is advisory and does not form part of the specification.	

**LIFE SUPPORT APPLICATIONS**

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

**PURCHASE OF PHILIPS I<sup>2</sup>C COMPONENTS**

Purchase of Philips I<sup>2</sup>C components conveys a license under the Philips' I<sup>2</sup>C patent to use the components in the I<sup>2</sup>C system provided the system conforms to the I<sup>2</sup>C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
