TANGO3 MC33493/D Rev. 1.6, 6/2002

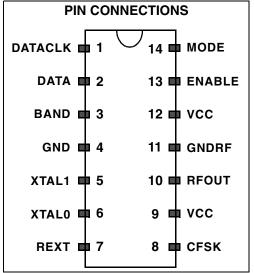

Technical Data

PLL tuned UHF Transmitter for Data Transfer Applications

FEATURES

- Selectable frequency bands: 315-434MHz and 868-928MHz
- OOK and FSK modulation
- Adjustable output power range
- Fully integrated VCO
- Supply voltage range: 1.9-3.6V
- Very low standby current: 0.1nA @ T_A=25°C
- Low supply voltage shutdown
- Data clock output for microcontroller
- Extended temperature range: -40°C to 125°C
- · Low external component count
- Typical application compliant with ETSI standard

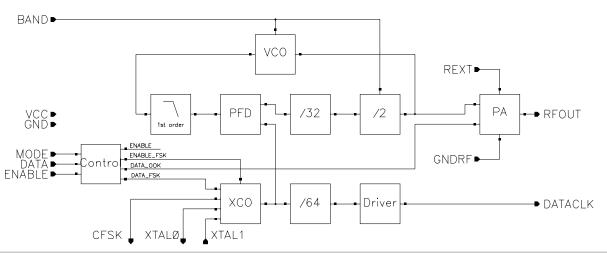

TSSOP-14

TRANSMITTER FUNCTIONAL DESCRIPTION

MC33493 is a PLL tuned low power UHF transmitter. The different modes of operation are controlled by the microcontroller through several digital input pins. The power supply voltage ranges from 1.9V to 3.6V allowing operation with a single lithium cell.

PHASE LOCKED LOOP AND LOCAL OSCILLATOR

The VCO is a completely integrated relaxation oscillator. The Phase Frequency Detector (PFD) and the loop filter are fully integrated. The exact output frequency is equal to: $f_{RFOUT} = f_{XTAL} \times [PLL Divider Ratio]$. The frequency band of operation is selected through the BAND pin.

Table 1 provides details for each frequency band selection.

BAND Input Level	Frequency Band (MHz)	PLL Divider Ratio	Crystal Oscillator Frequency (MHz)
High	315	32	9.84
riigii	434	32	13.56
Low	969	64	10.00

Table 1: Band selection and associated divider ratios

An out-of-lock function is performed by monitoring the PFD output voltage. When it exceeds defined limits, the RF output stage is disabled.

RF OUTPUT STAGE

The output stage is a single ended square wave switched current source. Harmonics are present in the output current drive. Their radiated absolute level depends on the antenna characteristics and output power. Typical application demonstrates compliance to ETSI standard.

A resistor R_{ext} connected to the REXT pin controls the output power allowing a trade-off between radiated power and current consumption.

The output voltage is internally clamped to $V_{cc} \pm 2V_{be}$ (typ. $V_{cc} \pm 1.5V \otimes T_A = 25^{\circ}C$).

MODULATION

A low logic level has to be applied on pin MODE to select the On Off Keying (OOK) modulation. This modulation is performed by switching on/off the RF output stage. The logic level applied on pin DATA controls the output stage state:

DATA=0 \rightarrow output stage off,

DATA=1 \rightarrow output stage on.

If a high logic level is applied on pin MODE, then Frequency Shift Keying (FSK) modulation is selected. This modulation is achieved by crystal pulling. An internal switch connected to CFSK pin enables to switch the external crystal load capacitors. Figure 2 shows the possible configurations: serial and parallel.

The logic level applied on pin DATA controls the state of this internal switch:

DATA= $0 \rightarrow$ switch off,

DATA=1 \rightarrow switch on.

DATA input is internally re-synchronized by the crystal reference signal. The corresponding jitter on the data duty cycle cannot exceed ± 1 reference period (± 75 ns for a 13.56MHz crystal).

This crystal pulling solution implies that the RF output frequency deviation equals the crystal frequency deviation multiplied by the PLL Divider Ratio (see table 1).

Figure 2: Crystal pulling configurations

MICROCONTROLLER INTERFACE

Four digital input pins (ENABLE, DATA, BAND and MODE) enable the circuit to be controlled by a microcontroller. It is recommended to configure the band frequency and the modulation type before enabling the circuit.

One digital output (DATACLK) provides to the microcontroller a reference frequency for data clocking. This frequency is equal to the crystal oscillator frequency divided by 64 (see table 2).

Table 2: DATACLK frequency vs crystal oscillator frequency

Crystal Oscillator Frequency (MHz)	DATACLK Frequency (kHz)
9.84	154
13.56	212

STATE MACHINE

Figure 3 details the state machine.

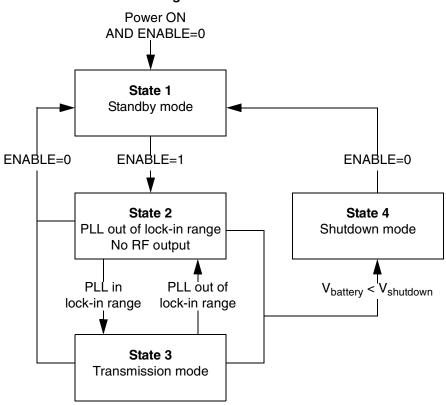

Figure 3: State machine

State 1:

The circuit is in standby mode and draws only a leakage current from the power supply.

State 2

In this state, the PLL is out of the lock-in range. Therefore the RF output stage is switched off preventing RF transmission. Data clock is available on pin DATACLK. Each time the device is enabled, the state machine passes through this state.

State 3:

In this state, the PLL is within the lock-in range. If $t < t_{PLL_lock_in}$ then the PLL can still be in acquisition mode. If $t \ge t_{PLL_lock_in}$, then the PLL is locked.

Data entered on pin DATA are output on pin RFOUT according to the modulation selected by the level applied on pin MODE.

State 4:

When the supply voltage falls below the shutdown voltage threshold (V_{SDWN}) the whole circuit is switched off. Applying a low level on pin ENABLE is the only condition to get out of this state.

Figure 4 shows the waveforms of the main signals for a typical application cycle.

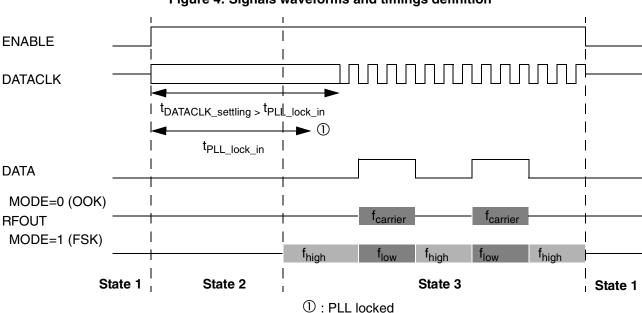

Figure 4: Signals waveforms and timings definition

POWER MANAGEMENT

When the battery voltage falls below the shutdown voltage threshold (V_{SDWN}) the whole circuit is switched off. It has to be noted that after this shutdown, the circuit is latched until a low level is applied on pin ENABLE (see state 4 of the state machine).

DATA CLOCK

At start-up data clock timing is valid after the data clock settling time. As clock is switched off asynchronously, the last period duration cannot be guaranteed.

ELECTRICAL CHARACTERISTICS

Unless otherwise specified, voltage range $V_{cc}=[V_{shutdown};3.6V]$, temperature range $T_A=[-40^{\circ}C;+125^{\circ}C]$, $R_{ext}=12k\Omega+/-5\%$, RF output frequency $f_{carrier}=433.92$ MHz, reference frequency $f_{reference}=13.560$ MHz, output load $R_L=50\Omega+/-1\%$ (figure 9). Values refer to the circuit shown in the recommended application schematics: figure 12 (14) for OOK (FSK) modulation. Typical values reflect average measurement at $V_{CC}=3V$, $T_A=25^{\circ}C$.

RF OUTPUT SPECTRUM

Following are spectrums of transmitter carrier, measured in conduction mode. Three different spans have been used. The 5MHz span spectrum (figure) shows phase noise response close to the RF carrier, and the noise suppression within the PLL loop bandwidth. The 50MHz span spectrum (figure 6) shows both phase noise and reference spurious. Finally figure 7 shows second and third harmonics of carrier. All these spectrums are measured in OOK modulation, at DATA=1.

Figure 8 shows spectrum in case of FSK modulation, with 45kHz deviation, at 4kbit/s data rate.

Freescale Semiconductor, Inc. OUTPUT POWER MEASUREMENT

OUTPUT POWER MEASUREMENT

The RF output levels given in the electrical characteristics section are measured with a 50Ω load directly connected to the pin RFOUT as shown below in figure 9. This wideband coupling method gives results independent of the application.

Figure 9: Output power measurement configurations

The configuration shown in figure 10-a provides a better efficiency in terms of output power and harmonics rejection. Schematic on figure 10-b gives the equivalent circuit of the pin RFOUT and the DC bias impeder as well as the matching network components for 434MHz frequency band.

Figure 10: Output model and matching network for 434MHz band

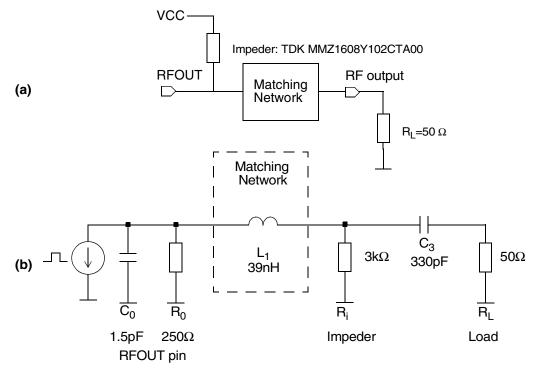

Figure 11 gives the output power versus the R_{ext} resistor value with 50 Ω load and with matching network.

Freescale Semiconductor, Inc. COMPLETE APPLICATION SCHEMATIC AND PCB FOR OOK MODULATION

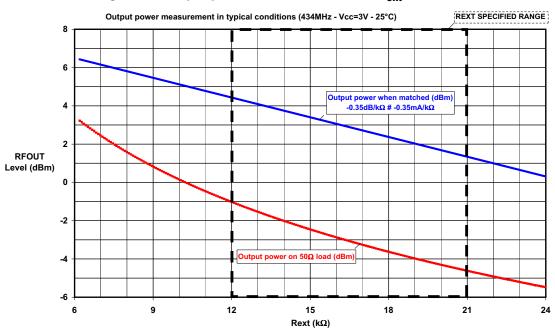

Figure 11: Output power at 434MHz band vs Rext value

The 50Ω matching network used for the 868MHz band is similar to the 434MHz, except components values: in figure 10b, L1 is changed to 8.2nH and C3 to 470pF. The typical gain of this 868MHz matching network is 4dB compared to unmatched configuration.

COMPLETE APPLICATION SCHEMATIC AND PCB FOR OOK MODULATION

Figure 12 gives a complete application schematic using a Motorola MC68HC908RK2 microcontroller. OOK modulation is selected, f_{carrier}= 433.92MHz. C₂ to C₅ capacitors can be removed if switches debounce is done by software.

C3	Crystal load capacitor	See table 6	pF
C4	Orystal load capacitor	occ table 0	pF
C2	Power supply decoupling	22	nF
C6	capacitor	100	pF

Figure 15 gives the corresponding PCB layout.

Figure 15: Application PCB layout for FSK modulation, serial configuration, 434MHz frequency band

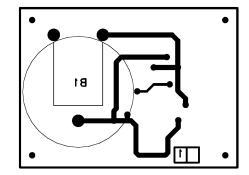

Table 6 gives the measured FSK deviations respective to C3 and C4 capacitor values for three deviations. Crystal reference is NDK NX8045GB/CSJ S1-40125-8050-12.

Table 6: Crystal pulling capacitor values versus carrier frequency total deviation -1-

Carrier frequency (MHz)	Carrier frequency total deviation (kHz)	C3 capacitor (pF)	C4 capacitor (pF)	Recommended R_off value (kΩ)
	45	4.7	6.8	10
434	70	2.2	10	-
	100	1	15	22
	90	4.7	6.8	10
868	140	2.2	10	-
	200	1	15	22

Another crystal reference, NDK NX1255GA (see table 4), enables to reach higher deviation as mentioned on table 7. These results are due to the higher crystal motional capacitor.

Table 7: Crystal pulling capacitor values versus carrier frequency total deviation -2-

Carrier frequency (MHz)	Carrier frequency total deviation (kHz)	C3 capacitor value (pF)	C4 capacitor value (pF)	Recommended R_off value (kΩ)
434	150	1	27	-
868	300	1	27	-

RECOMMENDATIONS FOR FSK MODULATION

FSK deviation is function of total load capacitance presented to the crystal. This load capacitance is constituted by various contributors:

- the crystal characteristic, especially its static capacitance,
- the external load capacitors (C3, C4 as defined in figure 14 and table 6),
- the device internal capacitance of pins XTAL0, XTAL1, CFSK,
- the PCB track capacitance.

The schematic given in figure 16 shows a typical FSK application using serial capacitor configuration, where device pads and PCB track capacitances are mentioned.

Device pad capacitance is defined by the package capacitance and by the internal circuitry. Typical capacitance values for these pads are given in table 8.

Some realistic assumptions and measurements have been made concerning track parasitic capacitances for a 0.8mm FR4 double side application PCB. They are given in table 8 and the corresponding PCB layout is shown in figure 15.

To achieve large deviations, this total load capacitance need to be lowered. For a given crystal, the PCB must be very carefully laid out in order to reduce as much as possible the capacitance of the tracks wired to XTALO,

Freescale Semiconductor, Inc. RECOMMENDATIONS FOR FSK MODULATION

XTAL1, CFSK pins.

Recommendation: a R_off resistor can be added in parallel with the FSK switch to optimize the transient response of demodulated signal. Table 6 gives the optimized R_off values for two deviations. Note that there is no footprint for R_off resistor on the layout figure 15. When used, this component can be soldered on top of C3.

Figure 16: Schematic detailing the crystal load capacitance contributors

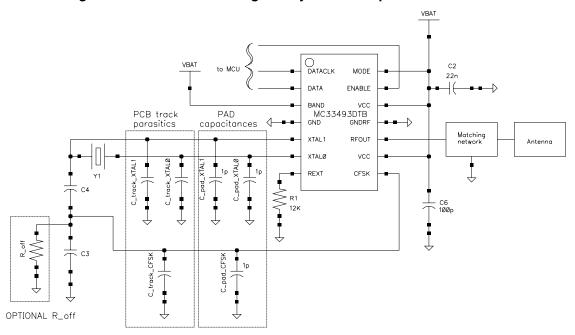

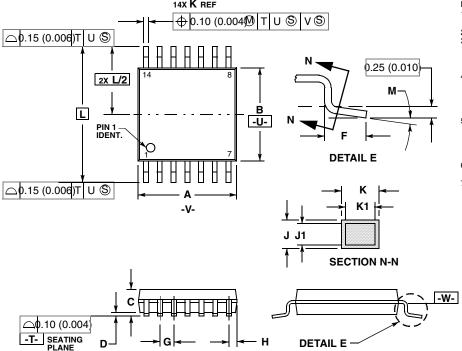

Table 8: Pads and tracks parasitic values

Capacitance	Value	Unit
C_pad_XTAL0	1	pF
C_pad_XTAL1	1	pF
C_pad_CFSK	1	pF
C_track_XTAL0	1.5	pF
C_track_XTAL1	1.5	pF
C_track_CFSK	1.5	pF

Information in this document is provided solely to enable system and software implementers to use Motorola products. There are no express or implied copyright licenses granted hereunder to design or fabricate any integrated circuits or integrated circuits based on the information in this document.

Motorola reserves the right to make changes without further notice to any products herein. Motorola makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does Motorola assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation consequential or incidental damages. "Typical" parameters which may be provided in Motorola data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. Motorola does not convey any license under its patent rights nor the rights of others. Motorola products are not designed, intended, or authorized for use as components in systems intended for surgical implant into the body, or other applications intended to support or sustain life, or for any other application in which the failure of the Motorola product could create a situation where personal injury or death may occur. Should Buyer purchase or use Motorola products for any such unintended or unauthorized application, Buyer shall indemnify and hold Motorola and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that Motorola was negligent regarding the design or manufacture of the part.

Motorola and the Stylized M Logo are registered in the U.S. Patent and Trademark Office. All other product or service names are the property of their respective owners. Motorola, Inc. is an Equal Opportunity/Affirmative Action Employer.
