

# LM4041

## Precision Micropower Shunt Voltage Reference

### General Description

Ideal for space critical applications, the LM4041 precision voltage reference is available in the sub-miniature (3 mm x 1.3 mm) SOT-23 surface-mount package. The LM4041's advanced design eliminates the need for an external stabilizing capacitor while ensuring stability with any capacitive load, thus making the LM4041 easy to use. Further reducing design effort is the availability of a fixed (1.225V) and adjustable reverse breakdown voltage. The minimum operating current is 60  $\mu$ A for the LM4041-1.2 and the LM4041-ADJ. Both versions have a maximum operating current of 12 mA. The LM4041 utilizes fuse and zener-zap reverse breakdown or reference voltage trim during wafer sort to ensure that the prime parts have an accuracy of better than  $\pm 0.1\%$  (A grade) at 25°C. Bandgap reference temperature drift curvature correction and low dynamic impedance ensure stable reverse breakdown voltage accuracy over a wide range of operating temperatures and currents.

### Features

- Small packages: SOT-23, and TO-92
- No output capacitor required
- Tolerates capacitive loads
- Reverse breakdown voltage options of 1.225V and adjustable

### Key Specifications (LM4041-1.2)

- |  |                    |
|--|--------------------|
| ■ Output voltage tolerance (A grade, 25°C) | $\pm 0.1\%$ (max)  |
| ■ Low output noise (10 Hz to 10kHz)        | $20\mu V_{rms}$    |
| ■ Wide operating current range             | 60 $\mu$ A to 12mA |
| ■ Industrial temperature range             | -40°C to +85°C     |
| ■ Extended temperature range               | -40°C to +125°C    |
| ■ Low temperature coefficient              | 100 ppm/°C (max)   |

### Applications

- Portable, Battery-Powered Equipment
- Data Acquisition Systems
- Instrumentation
- Process Control
- Energy Management
- Automotive
- Precision Audio Components

### Connection Diagrams

\*This pin must be left floating or connected to pin 2.

## SOT-23 Package Marking Information

Only three fields of marking are possible on the SOT-23's small surface. This table gives the meaning of the three fields.

Part Marking	Field Definition
R1A R1B R1C R1D R1E	First Field: R = Reference Second Field: 1 = 1.225V Voltage Option A = Adjustable Third Field:
RAC RAD	A–E = Initial Reverse Breakdown Voltage or Reference Voltage Tolerance A = ±0.1%, B = ±0.2%, C = ±0.5%, D = ±1.0%, E = ±2.0%

**Absolute Maximum Ratings** (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Reverse Current	20 mA
Forward Current	10 mA
Maximum Output Voltage (LM4041-ADJ)	15V
Power Dissipation ( $T_A = 25^\circ\text{C}$ ) (Note 2)	
M3 Package	306 mW
Z Package	550 mW
Storage Temperature	$-65^\circ\text{C}$ to $+150^\circ\text{C}$
Lead Temperature	
M3 Packages	
Vapor phase (60 seconds)	$+215^\circ\text{C}$
Infrared (15 seconds)	$+220^\circ\text{C}$

## Electrical Characteristics (continued)

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics. The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.

**Note 2:** The maximum power dissipation must be derated at elevated temperatures and is dictated by  $T_{Jmax}$  (maximum junction temperature),  $\theta_{JA}$  (junction to ambient thermal resistance), and  $T_A$  (ambient temperature). The maximum allowable power dissipation at any temperature is  $PD_{max} = (T_{Jmax} - T_A)/\theta_{JA}$  or the number given in the Absolute Maximum Ratings, whichever is lower. For the LM4041,  $T_{Jmax} = 125^\circ\text{C}$ , and the typical thermal resistance ( $\theta_{JA}$ ), when board mounted, is  $326^\circ\text{C/W}$  for the SOT-23 package, and  $180^\circ\text{C/W}$  with  $0.4''$  lead length and  $170^\circ\text{C/W}$  with  $0.125''$  lead length for the TO-92 package.

**Note 3:** The human body model is a  $100\text{ pF}$  capacitor discharged through a  $1.5\text{ k}\Omega$  resistor into each pin. The machine model is a  $200\text{ pF}$  capacitor discharged directly into each pin.

**Note 4:** Typical values are at  $T_J = 25^\circ\text{C}$  and represent most likely parametric norm.

**Note 5:** Limits are 100% production tested at  $25^\circ\text{C}$ . Limits over temperature are guaranteed through correlation using Statistical Quality Control (SQC) methods. The limits are used to calculate National's AOQL.

**Note 6:** The boldface (over-temperature) limit for Reverse Breakdown Voltage Tolerance is defined as the room temperature Reverse Breakdown Voltage Tolerance  $\pm[(\Delta V_R/\Delta T)(\max \Delta T)(V_R)]$ . Where,  $\Delta V_R/\Delta T$  is the  $V_R$  temperature coefficient,  $\max \Delta T$  is the maximum difference in temperature from the reference point of  $25^\circ\text{C}$  to  $T_{MAX}$  or  $T_{MIN}$ , and  $V_R$  is the reverse breakdown voltage. The total over-temperature tolerance for the different grades in the industrial temperature range where  $\max \Delta T = 65^\circ\text{C}$  is shown below:

A-grade:  $\pm 0.75\% = \pm 0.1\% \pm 100\text{ ppm}/^\circ\text{C} \times 65^\circ\text{C}$

B-grade:  $\pm 0.85\% = \pm 0.2\% \pm 100\text{ ppm}/^\circ\text{C} \times 65^\circ\text{C}$

C-grade:  $\pm 1.15\% = \pm 0.5\% \pm 100\text{ ppm}/^\circ\text{C} \times 65^\circ\text{C}$

D-grade:  $\pm 1.98\% = \pm 1.0\% \pm 150\text{ ppm}/^\circ\text{C} \times 65^\circ\text{C}$

E-grade:  $\pm 2.98\% = \pm 2.0\% \pm 150\text{ ppm}/^\circ\text{C} \times 65^\circ\text{C}$

The total over-temperature tolerance for the different grades in the extended temperature range where  $\max \Delta T = 100^\circ\text{C}$  is shown below:

B-grade:  $\pm 1.2\% = \pm 0.2\% \pm 100\text{ ppm}/^\circ\text{C} \times 100^\circ\text{C}$

C-grade:  $\pm 1.5\% = \pm 0.5\% \pm 100\text{ ppm}/^\circ\text{C} \times 100^\circ\text{C}$

D-grade:  $\pm 2.5\% = \pm 1.0\% \pm 150\text{ ppm}/^\circ\text{C} \times 100^\circ\text{C}$

E-grade:  $\pm 4.5\% = \pm 2.0\% \pm 150\text{ ppm}/^\circ\text{C} \times 100^\circ\text{C}$

Therefore, as an example, the A-grade LM4041-1.2 has an over-temperature Reverse Breakdown Voltage tolerance of  $\pm 1.2\text{V} \times 0.75\% = \pm 9.2\text{ mV}$ .

**Note 7:** When  $V_{OUT} \leq 1.6\text{V}$ , the LM4041-ADJ in the SOT-23 package must operate at reduced  $I_R$ . This is caused by the series resistance of the die attach between the die (-) output and the package (-) output pin. See the Output Saturation (SOT-23 only) curve in the Typical Performance Characteristics section.

**Note 8:** Reference voltage and temperature coefficient will change with output voltage. See Typical Performance Characteristics curves.

## Applications Information

The LM4041 is a precision micro-power curvature-corrected bandgap shunt voltage reference. For space critical applications, the LM4041 is available in the sub-miniature SOT-23 surface-mount package. The LM4041 has been designed for stable operation without the need of an external capacitor connected between the "+" pin and the "-" pin. If, however, a bypass capacitor is used, the LM4041 remains stable. Design effort is further reduced with the choice of either a fixed 1.2V or an adjustable reverse breakdown voltage. The minimum operating current is 60  $\mu$ A for the LM4041-1.2 and the LM4041-ADJ. Both versions have a maximum operating current of 12 mA.

LM4041s using the SOT-23 package have pin 3 connected as the (-) output through the package's die attach interface. Therefore, the LM4041-1.2's pin 3 must be left floating or connected to pin 2 and the LM4041-ADJ's pin 3 is the (-) output.

In a conventional shunt regulator application (*Figure 1*), an external series resistor ( $R_S$ ) is connected between the supply voltage and the LM4041.  $R_S$  determines the current that flows through the load ( $I_L$ ) and the LM4041 ( $I_Q$ ). Since load current and supply voltage may vary,  $R_S$  should be small enough to supply at least the minimum acceptable  $I_Q$  to the LM4041 even when the supply voltage is at its minimum and the load current is at its maximum value. When the supply voltage is at its maximum and  $I_L$  is at its minimum,  $R_S$  should be large enough so that the current flowing through the LM4041 is less than 12 mA.

$R_S$  should be selected based on the supply voltage, ( $V_S$ ), the desired load and operating current, ( $I_L$  and  $I_Q$ ), and the LM4041's reverse breakdown voltage,  $V_R$ .

$$R_S = \frac{V_S - V_R}{I_L + I_Q}$$

The LM4041-ADJ's output voltage can be adjusted to any value in the range of 1.24V through 10V. It is a function of the internal reference voltage ( $V_{REF}$ ) and the ratio of the external feedback resistors as shown in *Figure 2*. The output voltage is found using the equation

$$V_O = V_{REF}[(R_2/R_1) + 1] \quad (1)$$

where  $V_O$  is the output voltage. The actual value of the internal  $V_{REF}$  is a function of  $V_O$ . The "corrected"  $V_{REF}$  is determined by

$$V_{REF} = \Delta V_O (\Delta V_{REF}/\Delta V_O) + V_Y \quad (2)$$

where

$$V_Y = 1.240 \text{ V and}$$

$$\Delta V_O = (V_O - V_Y)$$

$\Delta V_{REF}/\Delta V_O$  is found in the Electrical Characteristics and is typically  $-1.55 \text{ mV/V}$ . You can get a more accurate indication of the output voltage by replacing the value of  $V_{REF}$  in equation (1) with the value found using equation (2).

Note that the actual output voltage can deviate from that predicted using the typical value of  $\Delta V_{REF}/\Delta V_O$  in equation (2): for C-grade parts, the worst-case  $\Delta V_{REF}/\Delta V_O$  is  $-2.5 \text{ mV/V}$ . For D-grade parts, the worst-case  $\Delta V_{REF}/\Delta V_O$  is  $-3.0 \text{ mV/V}$ .

**LIFE SUPPORT POLICY**

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
