# LM4545

# AC '97 Codec with Stereo Headphone Amplifier and National 3D Sound

# **General Description**

The LM4545 is an audio codec for PC systems which performs the analog-intensive function of the Analog Codec '97 Rev 1.03 Architecture. Using 18-Bit  $\Sigma\Delta$  A/D and D/A converters, the LM4545 provides 90dB of dynamic range.

The LM4545 was designed specifically to provide a high quality audio path and provide all analog functionality in a PC audio system. It features full duplex stereo A/D's and D/A's and an analog mixer with 4 stereo and 3 mono inputs, each of which has separate gain, attenuation and mute control. In addition, the LM4545 provides a stereo headphone amplifier with an independent gain control and National's 3D Sound stereo enhancement technology.

The LM4545 features AC-Link, a synchronous, fixed rate serial bus for connection to the digital AC '97 Controller. The separation of the analog and digital functions of the AC '97 architecture allows for system design flexibility and increased overall performance.

### **Key Specifications**

| ■ Analog Mixer Dynamic Range | 95dB (typ) |
|------------------------------|------------|
| ■ D/A Dynamic Range          | 89dB (typ) |
| ■ A/D Dynamic Range          | 90dB (typ) |

■ Headphone THD+N at 50mW into 32Ω 0.02% (typ)

### **Features**

- Audio Codec '97 compliant
- Stereo 18-Bit ΣΔ A/D's and D/A's with 128X oversampling
- Stereo headphone amp with separate gain control
- National's 3D Sound circuitry
- Power management support
- Digital Interface 3V and 5V compliant

# **Applications**

- Desktop PC Audio Systems
- Portable PC Audio Systems
- Mobile PC Audio Solutions

# **Operating Ratings**

Temperature Range

$$\begin{split} T_{MIN} &\leq T_A \leq T_{MAX} & -40^{\circ}C \leq T_A \leq 85^{\circ}C \\ \text{Analog Supply Range} & 4.2V \leq AV_{DD} \leq 5.5V \\ \text{Digital Supply Range} & 3.0V \leq DV_{DD} \leq 5.5V \end{split}$$

### **Electrical Characteristics** (Notes 1, 3)

The following specifications apply for  $AV_{DD} = 5V$ ,  $DV_{DD} = 5V$  unless otherwise noted. Limits apply for  $T_A = 25$ °C. The reference for 0dB is 1Vrms unless otherwise specified.

Note 1: All voltages are measured with respect to the ground pin, unless otherwise specified.

Note 2: These specifications are guaranteed by design and characterization; they are not production tested.

Note 3: Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. Electrical Characteristics state DC and AC electrical specifications under particular test conditions which guarantee specific performance limits. This assumes that the device is within the Operating Ratings. Specifications are not guaranteed for parameters where no limit is given, however, the typical value is a good indication of device performance.

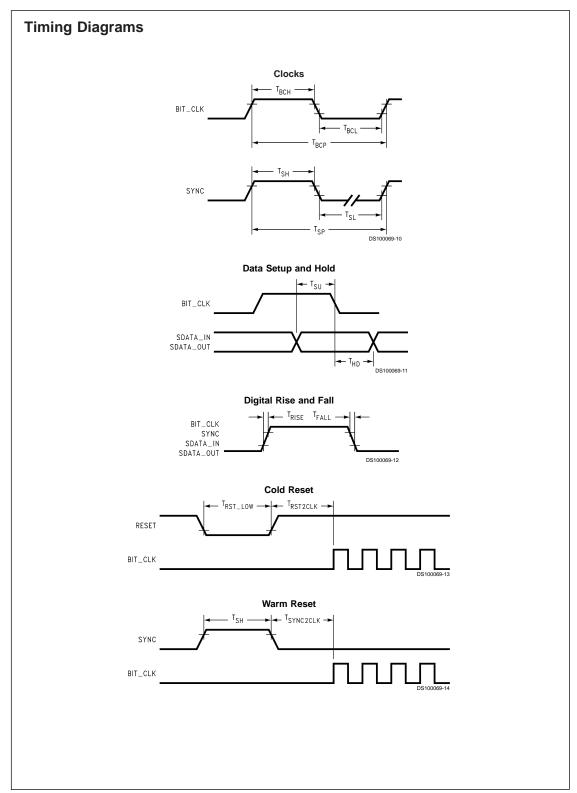

Note 4: The maximum power dissipation must be derated at elevated temperatures and is dictated by  $T_{JMAX}$ ,  $\theta_{JA}$ , and the ambient temperature  $T_A$ . The maximum allowable power dissipation is  $P_{DMAX} = (T_{JMAX} - T_A)/\theta_{JA}$  or the number given in Absolute Maximum Ratings, whichever is lower. For the LM4545,  $T_{JMAX} = 150^{\circ}C$ . The typical junction-to-ambient thermal resistance is 74°C/W for package number VBH48A.

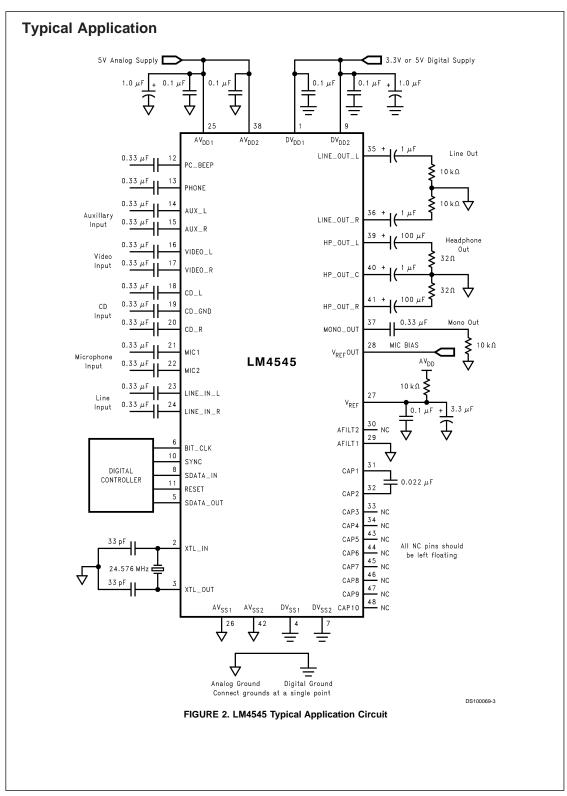

Note 5: Human body model, 100 pF discharged through a 1.5  $k\Omega$  resistor.

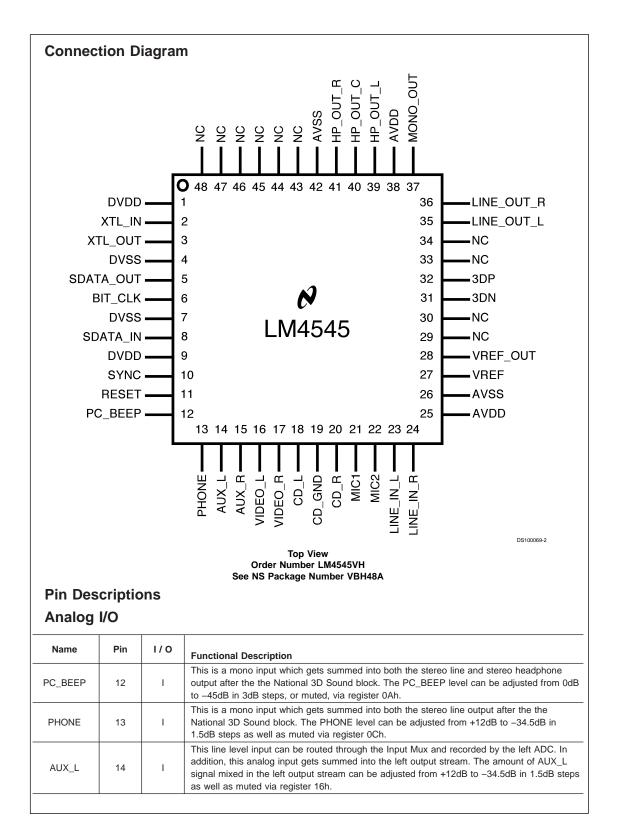

Note 6: Machine Model, 220 pF-240 pF discharged through all pins.

Note 7: Typicals are measured at 25°C and represent the parametric norm.

Note 8: Limits are guaranteed to National's AOQL (Average Outgoing Quality Level).

# Pin Descriptions (Continued)

# Analog I/O (Continued)

| Name       | Pin | 1/0 | Functional Description  |
|------------|-----|-----|---|
| AUX_R      | 15  | I   | This line level input can be routed through the Input Mux and recorded by the right ADC. In addition, this analog input gets summed into the right output stream. The amount of AUX_R signal mixed in the right output stream can be adjusted from +12dB to -34.5dB in 1.5dB steps as well as muted via register 16h.     |
| VIDEO_L    | 16  | ı   | This line level input can be routed through the Input Mux and recorded by the left ADC. In addition, this analog input gets summed into the left output stream. The amount of VIDEO_L signal mixed in the left output stream can be adjusted from +12dB to -34.5dB in 1.5dB steps as well as muted via register 14h.      |
| VIDEO_R    | 17  | ı   | This line level input can be routed through the Input Mux and recorded by the right ADC. In addition, this analog input gets summed into the right output stream. The amount of VIDEO_R signal mixed in the right output stream can be adjusted from +12dB to -34.5dB in 1.5dB steps as well as muted via register 14h.   |
| CD_L       | 18  | ı   | This line level input can be routed through the Input Mux and recorded by the left ADC. In addition, this analog input gets summed into the left output stream. The amount of CD_L signal mixed in the left output stream can be adjusted from +12dB to -34.5dB in 1.5dB steps as well as muted via register 12h.         |
| CD_GND     | 19  | ı   | This input can be used to reject common mode signals on the CD_L or CD_R inputs. CD_GND is an AC ground point not DC ground point. Thus, this input must be capacitively coupled and not directly coupled to analog ground.   |
| CD_R       | 20  | ı   | This line level input can be routed through the Input Mux and recorded by the right ADC. In addition, this analog input gets summed into the right output stream. The amount of CD_R signal mixed in the right output stream can be adjusted from +12dB to -34.5dB in 1.5dB steps as well as muted via register 12h.      |
| MIC1       | 21  | I   | Either MIC1 or MIC2 can be selected via software and routed through the Input Mux for recording. The 20dB boost circuit is enabled/disabled via register 0Eh. Also, the amount of mic signal mixed in the output stream can be adjusted from +12dB to -34.5dB in 1.5dB steps as well as muted via register 0Eh.           |
| MIC2       | 22  | ı   | Either MIC1 or MIC2 can be selected via software and routed through the Input Mux for recording. The 20dB boost circuit is enabled/disabled via register 0Eh. Also, the amount of mic signal mixed in the output stream can be adjusted from +12dB to -34.5dB in 1.5dB steps as well as muted via register 0Eh.           |
| LINE_IN_L  | 23  | ı   | This line level input can be routed through the Input Mux and recorded by the left ADC. In addition, this analog input gets summed into the left output stream. The amount of LINE_IN_L signal mixed in the left output stream can be adjusted from +12dB to -34.5dB in 1.5dB steps as well as muted via register 10h.    |
| LINE_IN_R  | 24  | ı   | This line level input can be routed through the Input Mux and recorded by the right ADC. In addition, this analog input gets summed into the right output stream. The amount of LINE_IN_R signal mixed in the right output stream can be adjusted from +12dB to -34.5dB in 1.5dB steps as well as muted via register 10h. |
| LINE_OUT_L | 35  | 0   | This is a post-mixed output for the left audio channel. The level of this output can be adjusted from 0dB to -45dB in 1.5dB steps as well as muted via register 02h.  |
| LINE_OUT_R | 36  | 0   | This is a post-mixed output for the right audio channel. The level of this output can be adjusted from 0dB to -45dB in 1.5dB steps as well as muted via register 02h.   |
| MONO_OUT   | 37  | 0   | This line level output is either the post-mixed output or the mic input. The level of this output can be adjusted from 0dB to -45dB in 1.5dB steps as well as muted via register 06h.   |
| HP_OUT_L   | 39  | 0   | This is a post-mixed output for the left audio channel. The level of this output can be adjusted from 0dB to -45dB in 1.5dB steps as well as muted via register 04h. HP_OUT_L has a nominal gain of 9dB with respect to the left output mixer level and is designed for driving a 32Ω impedance with minimal distortion.  |
| HP_OUT_C   | 40  | 1   | This input can be used to reject common mode signals on the headphone outputs. CD_GND is an AC ground point not DC ground point. Thus, this input must be capacitively coupled (not directly coupled) to analog ground.   |

# Pin Descriptions (Continued)

# Analog I/O (Continued)

| Name     | Pin | 1/0 | Functional Description   |
|----------|-----|-----|--|
| HP_OUT_R | 41  | 0   | This is a post-mixed output for the right audio channel. The level of this output can be adjusted from 0dB to -45dB in 1.5dB steps as well as muted via register 04h. HP_OUT_R has a nominal gain of 9dB with respect to the right output mixer level and is designed for driving a 32Ω impedance with minimal distortion. |

# Digital I/O and Clocking

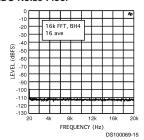

| Name      | Pin | 1/0 | Functional Description   |
|-----------|-----|-----|--|
| XTL_IN    | 2   | I   | 24.576 MHz crystal input. Use a fundamental-mode type crystal. When operating from a crystal, a $1M\Omega$ resistor must be connected across pins 2 and 3. |
| XTL_OUT   | 3   | 0   | 24.576 MHz crystal output. When operating from a crystal, a 1M $\Omega$ resistor must be connected across pins 2 and 3.                                    |
| SDATA_OUT | 5   | I   | This data stream contains both control data and DAC audio data. This input is sampled by the LM4545 on the falling edge of BIT_CLK.                        |
| BIT_CLK   | 6   | 0   | 12.288 MHz clock which is derived (divide by two) from the 24.576MHz crystal input (XTL_IN).   |
| SDATA_IN  | 8   | 0   | This data stream contains both control data and ADC audio data. This output is clocked out by the LM4545 on the rising edge of BIT_CLK.                    |
| SYNC      | 10  | I   | 48kHz sync pulse which signifies the beginning of both the SDATA_IN and SDATA_OUT serial streams. SYNC must be synchronous to BIT_CLK.                     |
| RESET#    | 11  | I   | This active low signal causes a hardware reset which returns the control registers to their default conditions.  |

# **Power Supplies and References**

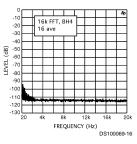

| Name    | Pin   | 1/0 | Functional Description   |
|---------|-------|-----|--|
| AVDD    | 25,38 | I   | Analog supply pins.  |
| AVSS    | 26,42 | I   | Analog ground pins.  |
| DVDD    | 1,9   | I   | Digital supply pins.   |
| DVSS    | 4,8   | I   | Digital ground pins.   |
| VREF    | 27    | 0   | Nominal 2.2V reference output. Not intended to sink or source current. Bypassing of this pin should be done with short traces to maximize performance.   |
| VREFOUT | 28    | 0   | Nominal 2.2V reference output. Can source up to 5mA of current and can be used to bias a microphone. Do not connect any external capacitance to this pin.  |
| AFILT1  | 29    | 0   | This pin is not used and should be left open (NC). However, a capacitor to ground on this pin is permitted as it will not affect performance.  |
| AFILT2  | 30    | 0   | This pin is not used and should be left open (NC). However, a capacitor to ground on this pin is permitted as it will not affect performance.  |
| 3DP,3DN | 31,32 | 0   | These pins are used to complete the National 3D Sound circuit. Connect a 0.022µF capacitor between pins 3DP and 3DN. The National 3D Sound can be turned on and off via control register 20h. This is a fixed-depth type stereo enhance circuit, thus writing to register 22h has no effect. If National 3D Sound is not desired, then these pins should be left as no connect (NC). |

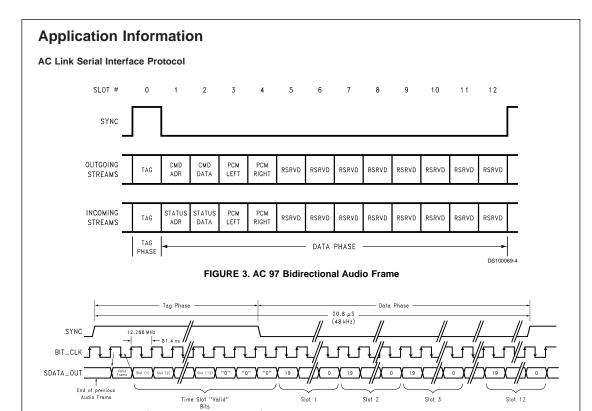

FIGURE 4. AC Link Audio Output Frame

#### **AC Link Output Frame**

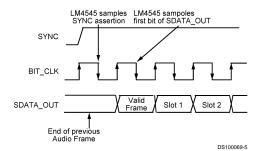

The audio output frame (output from AC '97 Controller and input to theLM4545 ) contains control and PCM data targeted for the LM4545 control register and stereo DAC. The Tag slot, slot 0, contains 16 bits that tell the AC Link interface circuitry on the LM4545 the validity of the following data slots.

("1" = time slot contains valid PCM data)

A new audio output frame is signaled with a low to high transition of SYNC. SYNC is synchronous to the rising edge of BIT\_CLK. On the next rising edge of BIT\_CLK, the AC '97 Controller drives SD\_OUT with the first bit of slot 0. The LM4545 samples SD\_OUT on the falling edge of BIT\_CLK. The AC '97 Controller will continue outputting the SD\_OUT stream on each successive rising edge of BIT\_CLK.

#### SD\_OUT Slot 0: Tag Phase

The first bit of slot 0 is designated the "Valid Frame" bit. If this bit is 1, it indicates that the current data frame contains at least one slot of valid data and the LM4545 will further sample the next four bits to determine which frames do in fact have valid data. Valid slots are signified by a 1 in their respective slot bit position.

DS100069-6

FIGURE 5. Start of Audio Output Frame

| Bit | Description                    | Comment         |
|-----|--------------------------------|-----------------|
| 15  | Valid Frame                    | 1 = Valid Frame |
| 14  | Control<br>register<br>address | 1 = Valid slot  |
| 13  | Control register data          | 1 = Valid slot  |
| 12  | Left Playback<br>PCM Data      | 1 = Valid slot  |

### Application Information (Continued)

| Bit | Description          | Comment        |
|-----|----------------------|----------------|
|     | Right                | 4 7/ 11 1 4    |
| 11  | Playback<br>PCM Data | 1 = Valid slot |

#### SD\_OUT Slot 1: Control Address

Slot 1 is used both to write to the LM4545 registers as well as read back a register's current value. The MSB of Slot 1 (bit 19) signifies whether the current control operation is a read or a write. Bits 18 through 12 are used to specify the register address of the read or write operation. The least significant twelve bits are reserved and should be stuffed with zeros by the AC'97 controller.

| Bits  | Description | Comment                |
|-------|-------------|------------------------|
| 19    | Read/Write  | 0 = Write, 1 = Read    |
| 18:12 | Control     | Identifies the Control |
| 10:12 | Register    | Register               |
| 11:0  | Reserved    | Set to "0"             |

#### SD\_OUT Slot 2: Control Data

Slot 2 is used to transmit 16 bit control data to the LM4545 in the event that the current operation is a write operation. The least significant four bits should be stuffed with zeros by the AC '97 controller. If the current operation is a register read, the entire slot, bits 19 through 0 should be stuffed with zeros.

| Bits | Description                       | Comment                           |
|------|-----------------------------------|-----------------------------------|
| 19:4 | Control<br>Register Write<br>Data | Set bits to "0" if read operation |
| 3:0  | Reserved                          | Set to "0"                        |

#### SD\_OUT Slot 3: PCM Playback Left Channel

Slot 3 is a 20 bit field used to transmit data intended for the left DAC on the LM4545. Any unused bits should be padded with zeros. The LM4545 DAC's have 18 bit resolution and thus will use the first 18 bits of the 20 bit PCM stream.

| Bits | Description                       | Comment                |
|------|-----------------------------------|------------------------|
| 19:0 | PCM Audio<br>Data for Left<br>DAC | Set unused bits to "0" |

#### SD\_OUT Slot 4: PCM Playback Right Channel

Slot 4 is a 20 bit field used to transmit data intended for the right DAC on the LM4545. Any unused bits should be padded with zeros. The LM4545 DAC's have 18 bit resolution and thus will use the first 18 bits of the 20 bit PCM stream.

| Bits | Description                        | Comment                |
|------|------------------------------------|------------------------|
| 19:0 | PCM Audio<br>Data for Right<br>DAC | Set unused bits to "0" |

#### SD\_OUT Slots 5-12: Reserved

Set these SD\_OUT slots to "0" as they are not currently used and are reserved for future use.

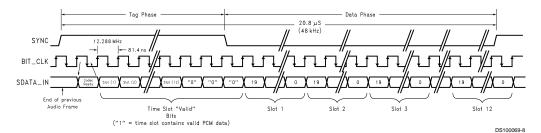

FIGURE 6. AC Link Audio Input Frame

#### **AC Link Input Frame**

The audio input frame (output from the LM4545 and input to the AC '97 Digital Controller) contains status and PCM data from the LM4545 control registers and stereo ADC. The Tag slot, slot 0, contains 16 bits that tell the AC '97 Digital Controller whether the LM4545 is ready and the validity of data from certain device subsections.

A new audio input frame is signaled with a low to high transition of SYNC. SYNC is synchronous to the rising edge of BIT\_CLK. On the next rising edge of BIT\_CLK, the LM4545 drives SD\_IN with the first bit of slot 0. The Digital Controller samples SD\_IN on the falling edge of BIT\_CLK. The LM4545 will continue outputting the SD\_IN stream on each successive rising edge of BIT\_CLK. The LM4545 outputs data MSB first, in a MSB justified format. All reserved bits and slots are stuffed with "0" 's by the LM4545.

### SD\_IN Slot 0: Codec Status Bits

The first bit of SD\_IN Slot 0 (bit 15), if asserted (="1"), indicates that the Codec is ready. The digital controller must probe further to see which other subsections are ready.

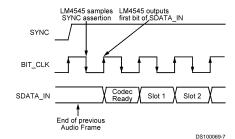

FIGURE 7. Start of Audio Input Frame

### **Application Information** (Continued)

| Bit | Description          | Comment                       |
|-----|----------------------|-------------------------------|
| 15  | Codec Ready<br>Bit   | 0=Not Ready, 1=Ready          |
| 14  | Slot 1 data<br>valid | Status Address is valid       |
| 13  | Slot 2 data<br>valid | Status Data is valid          |
| 12  | Slot 3 data<br>valid | Left Audio PCM Data is valid  |
| 11  | Slot 4 data<br>valid | Right Audio PCM Data is valid |

#### SD\_IN Slot 1: Status Address

The slot echoes the control register which a read was requested on. The address echoed was initiated by a read request in the previous SD\_OUT frame, slot 1.

| Bits  | Description               | Comment  |
|-------|---------------------------|--|
| 19    | Reserved                  | Stuffed with "0"   |
| 18:12 | Control<br>Register Index | Echo of Control Register for which data is being returned. |
| 11:0  | Reserved                  | Stuffed with "0" 's  |

#### SD IN Slot 2: Status Data

The slot returns the control register data. The data returned was initiated by a read request in the previous SD\_OUT frame\_slot 1

| Bits | Description   | Comment             |
|------|---------------|---------------------|
|      | Control       |                     |
| 19:4 | Register Read |                     |
|      | Data          |                     |
| 3:0  | Reserved      | Stuffed with "0" 's |

#### SD\_IN Slot 3: PCM Record Left Channel

This slot contains the left ADC sample data. The signal digitized is selected via register 1Ah and subsequently routed through the Input Mux for recording by the left ADC.

| Bits | Description                        | Comment                           |
|------|------------------------------------|-----------------------------------|
| 19:2 | PCM Record<br>Left Channel<br>data | 18 bit audio sample from left ADC |
| 1:0  | Reserved                           | Stuffed with "0"'s                |

#### SD\_IN Slot 4: PCM Record Right Channel

This slot contains the right ADC sample data. The signal digitized is selected via register 1Ah and subsequently routed through the Input Mux for recording by the right ADC.

| Bits | Description                         | Comment                            |
|------|-------------------------------------|------------------------------------|
| 19:2 | PCM Record<br>Right Channel<br>data | 18 bit audio sample from right ADC |
| 1:0  | Reserved                            | Stuffed with "0"'s                 |

#### SD\_IN Slots 5-12: Reserved

These SD\_IN slots are set to  $^{\prime\prime}0^{\prime\prime}$  as they are reserved for future use.

#### AC Link Low Power Mode

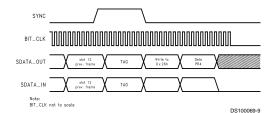

FIGURE 8. AC Link Powerdown Timing

#### Reset Register (00h)

Writing any value to this register causes a register reset which changes all of the registers back to their default values. If a read is performed on this register, the LM4545 will return a value of 0D50h implying that National 3D Sound is implemented, 18bit data is supported for both the ADC's and DAC's and the stereo headphone function is supported.

#### Master Volume Registers (02h, 04h, 06h)

These registers allows the output levels from LINE\_OUT port, HP\_OUT port and MONO\_OUT port to be attenuated or muted. Each step is nominally 1.5dB and each output can be individually muted by setting the most significant bit to 1.

| Mute           | Mx5:Mx0 | Function           |
|----------------|---------|--------------------|
| 0              | 00 0000 | 0dB attenuation    |
| 0              | 01 1111 | 46.5dB attenuation |
| 0              | 1X XXXX | 46.5dB attenuation |
| 1              | XX XXXX | mute               |
| Default: 8000h |         |                    |

#### PC Beep Register (0Ah)

This register controls the level of the PC\_BEEP input. The PC\_BEEP can be both attenuated and muted via register 0Ah. Step size is nominally 3dB. The signal present after the attenuation and mute block is summed into both the left and right channels.

| Mute           | PV3:0 | Function         |
|----------------|-------|------------------|
| 0              | 0000  | 0dB attenuation  |
| 0              | 1111  | 45dB attenuation |
| 1              | XXXX  | mute             |
| Default: 8000h |       |                  |

#### Mixer Input Volume Registers (Index 0Ch - 18h)

These registers control the input volume controls including mute. Each volume control is 5 bit which provides from a range of +12dB gain to 34.5dB attenuation. For stereo ports, the left and right levels can be independently set. Muting a given port is accomplished by setting the MSB to 1. Setting the MSB to 1 for stereo ports mutes both the left and right channel. Register 0Eh has an additional 20dB boost for a microphone level input. This is enabled by setting bit 6 of register 0Eh to 1.

### **Application Information** (Continued)

| Mute   | Gx4:Gx0 | Function           |
|--|---------|--------------------|
| 0  | 00000   | +12dB gain         |
| 0  | 01000   | 0dB gain           |
| 0  | 01111   | 34.5dB attenuation |
| 1  | XXXXX   | mute               |
| Default: 8008h (mono regs.) 8808h (stereo regs.) |         |                    |

Default: 8008h (mono regs.), 8808h (stereo regs.)

#### Record Select Register (1Ah)

This register independently controls the source for the right and left channel which will be recorded by the stereo ADC. The default value is 0000h which corresponds to Mic in.

| SL2:SL0          | Left Record Source                            |
|------------------|---|
| 0                | Mic   |
| 1                | CD In (L)                                     |
| 2                | Video In (L)                                  |
| 3                | Aux In (L)                                    |
| 4                | Line In (L)                                   |
| 5                | Stereo Mix (L)                                |
| 6                | Mono Mix (L)                                  |
| 7                | Phone   |
| SR2:SR0          | Right Record Source                           |
| 0                |   |
| 1                | Mic   |
| 1                | Mic<br>CD In (R)                              |
|                  | · ·   |
| 1                | CD In (R)                                     |
| 1 2              | CD In (R)<br>Video In (R)                     |
| 1 2 3            | CD In (R) Video In (R) Aux In (R)             |
| 1<br>2<br>3<br>4 | CD In (R) Video In (R) Aux In (R) Line In (R) |

#### Record (Input) Gain Register (1Ch)

This register controls the Record (Input) Gain level for the stereo input selected via the Record Select Control Register (1Ah). The gain can be programmed from 0dB to +22.5dB in 1.5dB steps. The level for the left and right channel can be individually controlled. The input can also be muted by setting the MSB to 1.

| Mute           | Gx3:Gx0 | Function    |  |
|----------------|---------|-------------|--|
| 0              | 1111    | 22.5dB gain |  |
| 0              | 0000    | 0dB gain    |  |
| 1              | XXXX    | mute        |  |
| Default: 8000h |         |             |  |

#### General Purpose Register (20h)

This register controls many miscellaneous functions implemented on the LM4545. The miscellaneous functions include: POP which allows the PCM to bypass the National 3D Sound circuitry, 3D which enables or disables the National 3D Sound circuitry, MIX which selects the MONO\_OUT source, MS which selects the microphone mux source and LPBK which connects the output of the stereo ADC to input of the stereo DAC. LPBK provides for a digital loopthru path when enabled.

| BIT  | Function                                       |
|------|--|
| POP  | PCM out path and mute, 0 = pre 3D, 1 = post 3D |
| 3D   | National 3D Sound on / off 1 = on              |
| MIX  | Mono output select 0 = Mix, 1 = Mic            |
| MS   | Mic select 0 = Mic1 1 = Mic2                   |
| LPBK | ADC/DAC loopback                               |

### Powerdown Control / Status Register (26h)

This read/write register is used to monitor subsystem readiness and program LM4545 powerdown states. The lower half of this register is read only with a "1" indicated the subsection is ready. Writing to the lower 8 bits will have no effect. When the AC Link "Codec Ready" indicator bit (SDATA\_IN slot 0, bit 15) is a 1 it indicates that the AC Link and AC '97 registers are in a fully operational state. The AC '97 Controller must further probe the Powerdown Control / Status Register to determine exactly which subsections are ready.

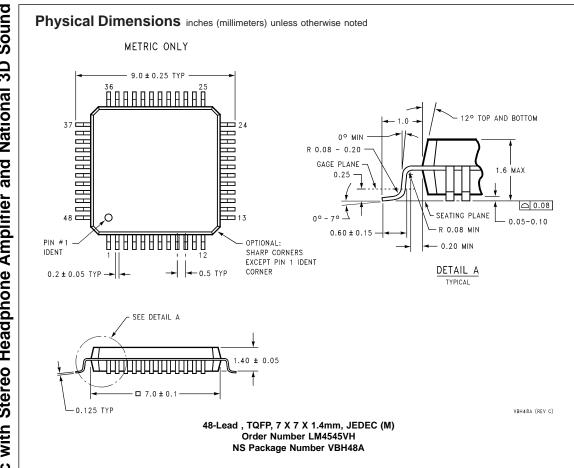

| BIT | Function                           |
|-----|------------------------------------|
| REF | Vref's up to nominal level         |
| ANL | Analog mixers ready                |
| DAC | DAC section ready to accept data   |
| ADC | ADC section ready to transmit data |

The supported powerdown modes are as follows.

| BIT | Function   |
|-----|--|
| PRO | PCM in ADC's and Input Mux powerdown                     |
| PR1 | PCM out DAC's powerdown                                  |
| PR2 | Analog Mixer powerdown (VREF still on)                   |
| PR3 | Analog Mixer powerdown (VREF off)                        |
| PR4 | Digital Interface (AC Link) powerdown (external clk off) |
| PR5 | Internal Clk disable                                     |
| PR6 | HP Amp powerdown   |

### Reserved Registers (28h - 7Ah)

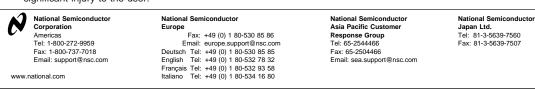

Do not write to these registers as they are reserved.

#### LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

- 1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
- 2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

National does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and National reserves the right at any time without notice to change said circuitry and specifications.
