

Appendix B  
Programming  
Examples

APPENDIX B. PROGRAMMING EXAMPLES

CONTENTS

B. PROGRAMMING EXAMPLES.....	B-1
B.1 FIR FILTER.....	B-2
B.2 IIR FILTER.....	B-5
B.3 MATRIX MULTIPLICATION.....	B-7
B.4 FIND MAXIMUM VECTOR ELEMENT.....	B-9

## B. PROGRAMMING EXAMPLES

This appendix contains DSP16/DSP16A source-file listings for four complete sample programs. These programs are intended to demonstrate the use of various programming techniques and may be easily modified for use in various applications. Comments within the source files provide all the information necessary to understand the program's function and to make minor modifications.

The programs included are:

- FIR filter
- IIR filter
- $4 \times 4$  matrix multiplication
- Find the maximum element in a vector

## B.1 FIR FILTER

```

/*
/* DSP16/DSP16A FIR filter design example:
/*
/*
/* The following code represents a 66th
/* order FIR filter. Linear inputs are provided
/* via the serial input. Linear outputs are sent
/* to the serial output.
/*
/*
/* The filter was designed using a Hamming
/* window on an ideal lowpass filter with the following
/* parameters.
/*
/* f(cutoff) = 1000 Hz
/* f(stop) = 1500 Hz
/* f(sample) = 10000 Hz
/*
/*
/* The stopband attenuation is constrained to be
/* above 50 dB.
/*
/*

.ram
X66: 65*int
X1: int
ibuf: int
.endram

/*
/* 66th order FIR filter
/*
/* This FIR example uses a modulo addressed
/* delay line. Outputs are calculated from X(n-66)
/* toward X(n). The inner loop of the filter uses
/* 67 multiplies and requires 89 cycles (6.7  $\mu$ s at 75 ns),
/* which easily meets the 10000 Hz requirement (100  $\mu$ s).
/*
/*
/* a0: scratch calculations
/* r0: input buffer location
/* r1: delay line pointer
/* pt: coefficient pointer
/*
/* Also modifies rb, re, i, x, y, p, sdx
/*

```

B.2 IIR FILTER

```

/*
/* DSP16/DSP16A IIR filter design example:
/*
/* The following code represents a 5th
/* order IIR filter. It is implemented as 3 five
/* multiply second-order sections. (Thus the code is
/* actually the same as a 6th order filter). Linear
/* inputs are provided via the serial input and
/* prescaled with no loss of precision. Linear outputs
/* are sent to the serial output.
/*
/* The filter was designed by performing a
/* bilinear transformation on a classical elliptic filter
/* designed with the following parameters.
/*
/* f(cutoff) = 1000 Hz
/* f(stop) = 1500 Hz
/* f(sample) = 10000 Hz
/*
/* The stopband attenuation is constrained to be
/* above 50 dB.
/*
.ram
statev: 6*int /* Six state variables
.endram

/* The IIR coding example uses the following
/* DSP16/DSP16A resources:
/*
/* a0: input/output for each section
/* r1: state variable pointer
/* pt: pointer to filter coefficients
/* j, k: for compound addressing mode
/*
/* This coding example demonstrates the use of
/* compound addressing for maintaining the state
/* variable delay line. The form is direct form II.

```

PROGRAMMING EXAMPLES  
Matrix Multiplication

B.3 MATRIX MULTIPLICATION

```

/*
/* DSP16/DSP16A 4x4 matrix multiply programming example: */
/*
/* The following code implements a 4x4 matrix multiply. */
/* In this example matrices A and B are input through */
/* the parallel i/o prior to being multiplied. The result */
/* is stored in matrix C. Matrices are input row by row */
/* and stored in row order. The resulting C matrix is */
/* stored in the same fashion. */
/*
/* The matrix multiply routine demonstrates the */
/* use of "fast sets" to perform pointer arithmetic */
/* both inside and outside of the cache. */
/*
/* Ram variables */
.ram
A: 16*int
B: 16*int
C: 16*int
.endram

/* Matrix Multiply routine: */
/*
/* r1: points to A */
/* r0: points to B */
/* r2: points to C */
/*
/* where C = A * B */
/*
/* a0, c1, rb, re, j, x, y registers are also */
/* used. */

```
