

DALLAS

SEMICONDUCTOR

DS1233M

EconoReset

FEATURES

- Automatically restarts microprocessor after power failure
- Maintains reset for 350 ms after V_{CC} returns to an in-tolerance condition
- Reduces need for discrete components
- Precision temperature-compensated voltage reference and voltage sensor
- Low-cost TO-92 package or surface mount 8-pin SOIC packages available
- Internal 5 K Ω pull-up resistor
- Compatible with Motorola 68XXX series and HC16 Microprocessors
- Pin function compatible with the Motorola MC33064, MC34064, MC33164, and MC34164
- Operating temperature of -40°C to $+85^{\circ}\text{C}$

DESCRIPTION

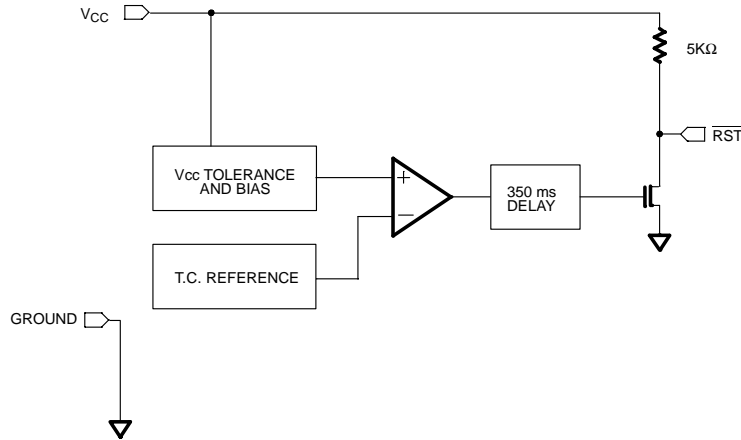

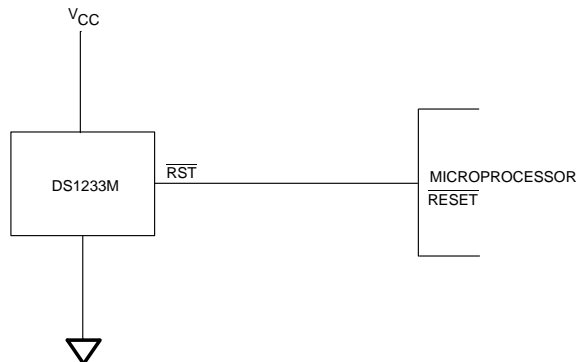

The DS1233M EconoReset uses a precision temperature compensated reference and comparator circuit to monitor the status of the power supply (V_{CC}). When an out-of-tolerance condition is detected, an internal power fail signal is generated which forces reset to the active

(low) state. When V_{CC} returns to an in-tolerance condition, the reset signal is kept in the active state for approximately 350 ms to allow the power supply and processor to stabilize.

OPERATION – POWER MONITOR

The DS1233M provides the functions of detecting out-of-tolerance power supply conditions and warning a processor-based system of impending power failure. When V_{CC} is detected as out-of-tolerance, as defined

by the tolerance of the part selected, the \overline{RST} signal is asserted. On power-up, \overline{RST} is kept active for approximately 350 ms after the power supply has reached the selected tolerance. This allows the power supply and microprocessor to stabilize before \overline{RST} is released.

ABSOLUTE MAXIMUM RATINGS*

Voltage on V_{CC} Pin Relative to Ground	-0.5V to +7.0V
Voltage on I/O Relative to Ground	-0.5V to $V_{CC} + 0.5V$
Operating Temperature	-40°C to +85°C
Storage Temperature	-55°C to +125°C
Soldering Temperature	260°C for 10 seconds

* This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

NOTES:

1. All voltages are referenced to ground.
2. Measured with $V_{CC} \geq 2.7V$.
3. A 1K Ω external resistor may be required in some applications for proper operation of the microprocessor reset control circuit.
4. Measured with outputs open.
5. $t_R = 5 \mu s$.
