

# **DS21T05 SCSI Terminator**

#### www.dalsemi.com

## **FEATURES**

- Fully compliant with SCSI-1, Fast SCSI and Ultra SCSI
- Functionally compatible to the DS21T07, targeted for high volume applications
- Provides active termination for nine signal
- Laser-trimmed 110-ohm termination resistors have 5% tolerance
- Low dropout voltage
- Power-down mode isolates termination resistors from the bus
- SCSI bus hot-plug compatible
- Fully supports actively negated SCSI signals
- Onboard thermal shutdown circuitry
- 16-pin plastic narrow SOIC

## PIN ASSIGNMENT

DS21T05S 16-Pin SOIC (300-mil)

## DESCRIPTION

Fast SCSI and Ultra SCSI require the use of active terminations at both ends of every cable segment in a SCSI system with single-ended drivers and receivers. The DS21T05 SCSI Terminator, which is fully compliant with these standards, enables the designer to gain the benefits of active termination: greater immunity to voltage drops on the TERMPWR (TERMination PoWeR) line, enhanced high-level noise immunity, intrinsic TERMPWR decoupling, and very low quiescent current consumption. The DS21T05, which integrates a regulator and nine precise-switched, 110-ohm termination resistors into a monolithic IC, is a functionally compatible version of the DS21T07. With relaxed output current and termination tolerances, the DS21T05 is intended for high volume applications which require active termination but not the high performance of the DS21T07.

#### FUNCTIONAL DESCRIPTION

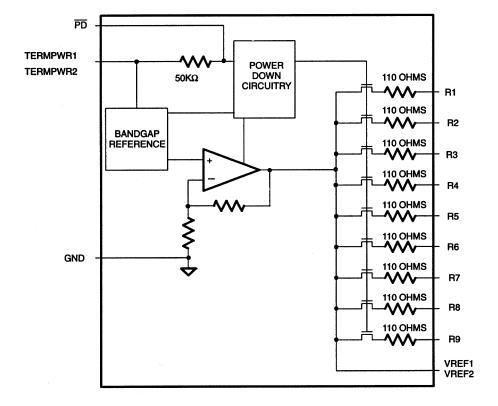

The DS21T05 consists of a bandgap reference, buffer amplifier, and nine termination resistors (Figure 1). The bandgap reference circuit produces a precise 2.55V level which is fed to a buffer amplifier. The buffer produces a 2.85V level and is capable of sourcing at least 24 mA into each of the termination resistors when the signal line is low (active). When the driver for a given signal line turns off, the terminator will pull the signal line to 2.85V (quiescent state). To handle actively negated SCSI signals,

> 1 of 7 112099

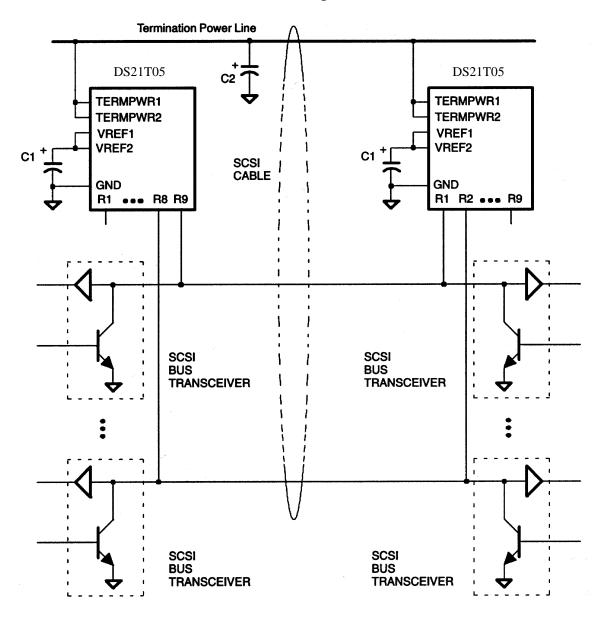

the buffer can sink 200 mA, and  $V_{REF}$  will move less than 60 mV. When all lines settle in the quiescent state, the regulator will consume about 5 mA. When the DS21T05 is put into power-down mode by bringing  $\overline{PD}$  low, the power-down circuitry will turn off the transistors on each signal line. This will isolate the DS21T05 from the signal lines and effectively remove it from the circuit. The power-down pin  $(\overline{PD})$  has an internal 50 k $\Omega$  pullup resistor. To place the DS21T05 into an active state, the  $\overline{PD}$  pin should be left open circuited. When installed on disk drives or RAID system components, the DS21T05 will not affect the SCSI bus during a hot plug operation.

To ensure proper operation, both the TERMPWR1 and TERMPWR2 pins must be connected to the SCSI bus TERMPWR line and both the VREF1 and VREF2 pins must be tied together externally. Each DS21T05 requires a 4.7 μF capacitor connected between the VREF pins and ground. Figure 2 details a typical SCSI bus configuration. In an 8-bit wide SCSI bus arrangement, two DS21T05s would be needed at each end of the SCSI cable in order to terminate the 18 active signal lines. In a 16-bit wide SCSI bus arrangement, three DS21T05's would be needed at each end of the SCSI cable in order to terminate the 27 active signal lines.

## **DS21T05 BLOCK DIAGRAM** Figure 1

## **TYPICAL SCSI BUS CONFIGURATION** Figure 2

## **NOTES:**

- 1.  $C1 = 4.7 \mu F$  tantalum  $C2 = 2.2 \mu F$  tantalum or  $4.7 \mu F$  aluminum
- 2. If the DS21T05 is to be embedded into a peripheral that will act as a target on a SCSI bus, it is recommended that TERMPWR be derived from the SCSI cable, not generated locally. In this configuration, if a power failure occurs in the peripheral, it will not affect the bus.
- 3. A high frequency bypass capacitor (0.1  $\mu$ F recommended) can be added in parallel to C1 for applications using fast rise/fall time drivers.

## **PIN DESCRIPTION** Table 1

| <b>DS21T05Z</b> | SYMBOL   | DESCRIPTION  |
|-----------------|----------|--|
| PIN             |          |  |
| 1               | TERMPWR1 | <b>Termination Power 1.</b> Should be connected to the SCSI TERMPWR      |
|                 |          | line. Must be decoupled with either a 2.2 µF or 4.7 µF. See Figure 2.    |
| 2               | R1       | <b>Signal Termination 1.</b> 110-ohm termination.                        |
| 3               | R2       | <b>Signal Termination 2.</b> 110-ohm termination.                        |
| 4               | R3       | <b>Signal Termination 3.</b> 110-ohm termination.                        |
| 5               | R4       | <b>Signal Termination 4.</b> 110-ohm termination.                        |
| 6               | R5       | <b>Signal Termination 5.</b> 110-ohm termination.                        |
| 7               | VREF1    | <b>Reference Voltage 1.</b> Must be externally connected directly to the |
|                 |          | VREF2 pin. Must be decoupled with a 4.7 µF capacitor as shown in         |
|                 |          | Figure 2.  |
| 8               | GND      | <b>Ground.</b> Signal ground; 0.0V.                                      |
| 9               | TERMPWR2 | <b>Termination Power 2.</b> Should be connected to the SCSI TERMPWR      |
|                 |          | line. Must be decoupled with either a 2.2 µF or 4.7 µF. See Figure 2.    |
| 10              | NC       | <b>No Connect.</b> Do not connect any signal to this pin.                |
| 11              | R6       | <b>Signal Termination 6.</b> 110-ohm termination.                        |
| 12              | R7       | <b>Signal Termination 7.</b> 110-ohm termination.                        |
| 13              | R8       | <b>Signal Termination 8.</b> 110-ohm termination.                        |
| 14              | R9       | <b>Signal Termination 9.</b> 110-ohm termination.                        |
| 15              | VREF2    | <b>Reference Voltage 2.</b> Must be externally connected directly to the |
|                 |          | VREF1 pin. Must be decoupled with a 4.7 µF capacitor as shown in         |
|                 |          | Figure 2.  |
| 16              | PD       | <b>Power Down.</b> When tied low, the DS21T05 enters a power-down        |
|                 |          | mode. Contains an internal 50K pull-up. Strap low to deactivate the      |
|                 |          | DS21T05, leave open circuited to activate the DS21T05.                   |

## **ABSOLUTE MAXIMUM RATINGS\***

Voltage on Any Pin Relative to Ground -1.0V to +7.0V Operating Temperature  $0^{\circ}$ C to  $70^{\circ}$ C Storage Temperature  $-55^{\circ}$ C to  $+125^{\circ}$ C Soldering Temperature  $260^{\circ}$ C for 10 seconds

\* This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods of time may affect reliability.

The Dallas Semiconductor DS21T05 is built to the highest quality standards and manufactured for long term reliability. All Dallas Semiconductor devices are made using the same quality materials and manufacturing methods. However, the DS21T05 is not exposed to environmental stresses, such as burnin, that some industrial applications require. For specific reliability information on this product, please contact the factory in Dallas at (972) 371-4448.

## RECOMMENDED OPERATING CONDITIONS
