

Using the Hall Decoder (HD) eTPU Function

Covers the MCF523x, MPC5500, and all eTPU-equipped devices

1 Introduction

The Hall Decoder (HD) enhanced Time Processor Unit (eTPU) function is one of the functions in the motor-control set of the eTPU functions (set3). This application note is intended to provide simple C interface routines to the HD eTPU function. The routines are targeted at the MCF523x family of devices, but they could be easily used with any device that has an eTPU.

2 Function Overview

The Hall Decoder (HD) eTPU function is intended to process signals generated by Hall sensors in motion control systems. It uses one, two, three, or four channels to decode Hall sensor signals, and to produce position and direction information for the CPU. HD also provides a capability to commutate motor phases driven by the PWMC function.

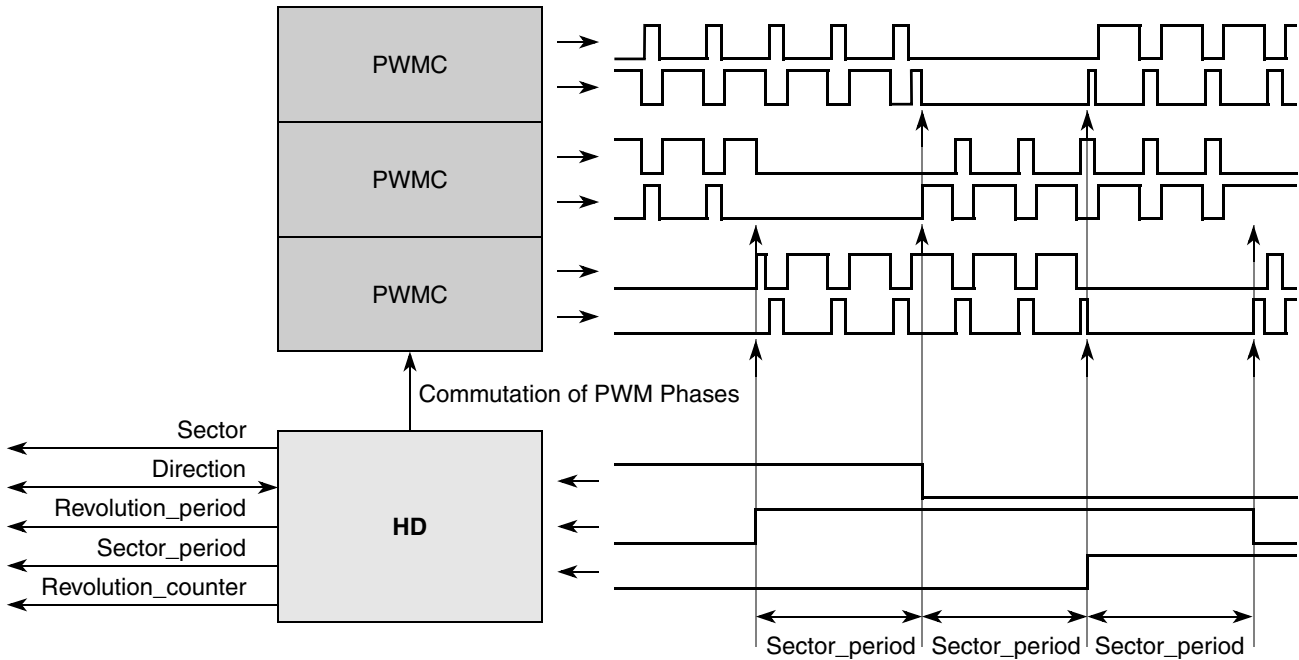

Figure 1. Functionality of HD

3 Function Description

The HD function uses one to four eTPU channels configured as inputs. The primary purpose of this function is to decode the signals derived from Hall effect sensors used with a brushless motor, and perform commutations of PWM phases. HD function calculates the following parameters for the CPU:

- Sector** - This parameter determines the position of the motion system in one of the sectors. Sector parameter value is encoded based on the input signal states; see Figure 2.

Figure 2. Encoding Sector Parameter

- Direction** - This parameter determines the direction of the motion system. A Direction value of 0 indicates a positive (incremental) direction, other values a negative (decremental) direction. The Direction is calculated only in configurations with 3 or 4 input channels (phases).
- Revolution Counter** - This parameter determines the number of motion system revolutions. The Revolution counter is incremented or decremented on each revolution, based on the current direction. The Revolution Counter is calculated only in configurations with 3 or 4 input channels (phases).

- **Revolution Period** - This parameter determines the TCR time of the last revolution. The parameter value is updated each time the sector is changed. The Revolution Period is measured from the last edge of similar type (low-high / high-low), on the same channel, to the current edge.
- **Sector Period** - This parameter determines the TCR time between the last two changes of the Sector. The parameter value is updated each time the sector is changed. The Sector Period is measured from the last edge to the current edge; see [Figure 3](#).

Figure 3. Measuring Revolution Period and Sector Period

- **Last Edge Time** - This parameter stores the TCR time of the last incoming edge.

The HD function is capable of performing commutations to PWMC phases. A detailed description of commutation is in [Section 3.2, “Commutation.”](#)

3.1 Example Configurations

The HD function has been designed to provide as much flexibility as possible in processing the Hall sensor signals and driving the commutations. This flexibility may allow the HD function to meet the needs of unusual drive schemes, for example, when used in driving an SR motor. However, since the primary purpose of the HD function is to drive BLDC motors in a conventional manner, there are several pre-defined configurations. The Hall sensor positions on stator and generated Hall sensor signals of the pre-defined configurations are illustrated in [Figure 4](#) through [9](#). Each of the pre-defined configuration covers the number of phases, internal masks for setting the direction, and other settings.

Function Description

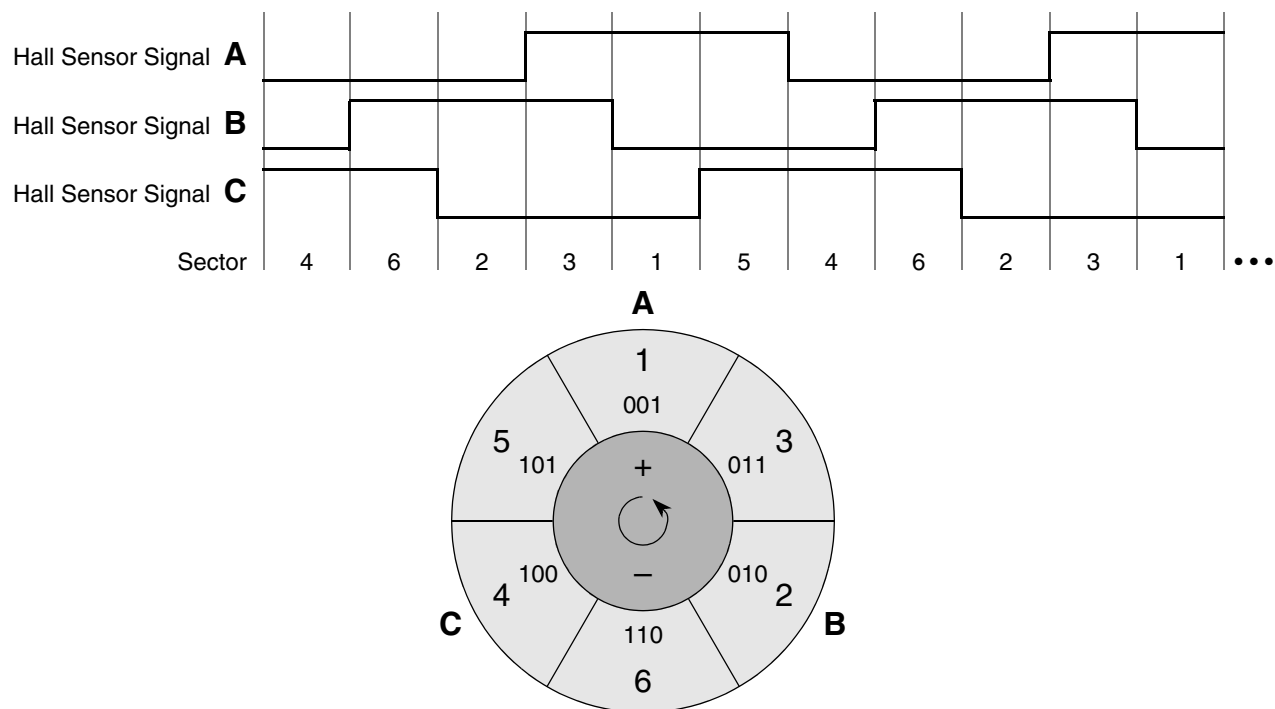

Figure 7. Pre-Defined Configurations: Three Phases - by 120 Deg

Function Description

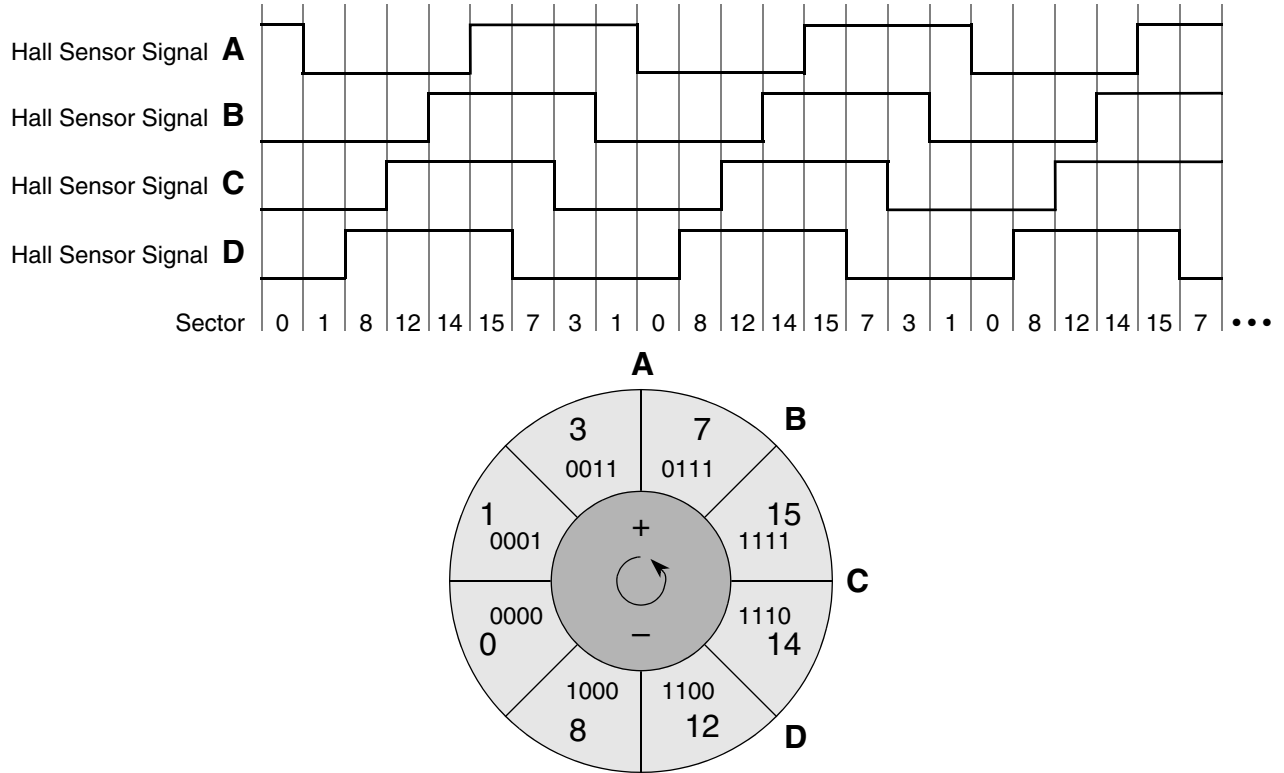

Figure 8. Pre-defined Configurations: Four Phases - by 45 Deg

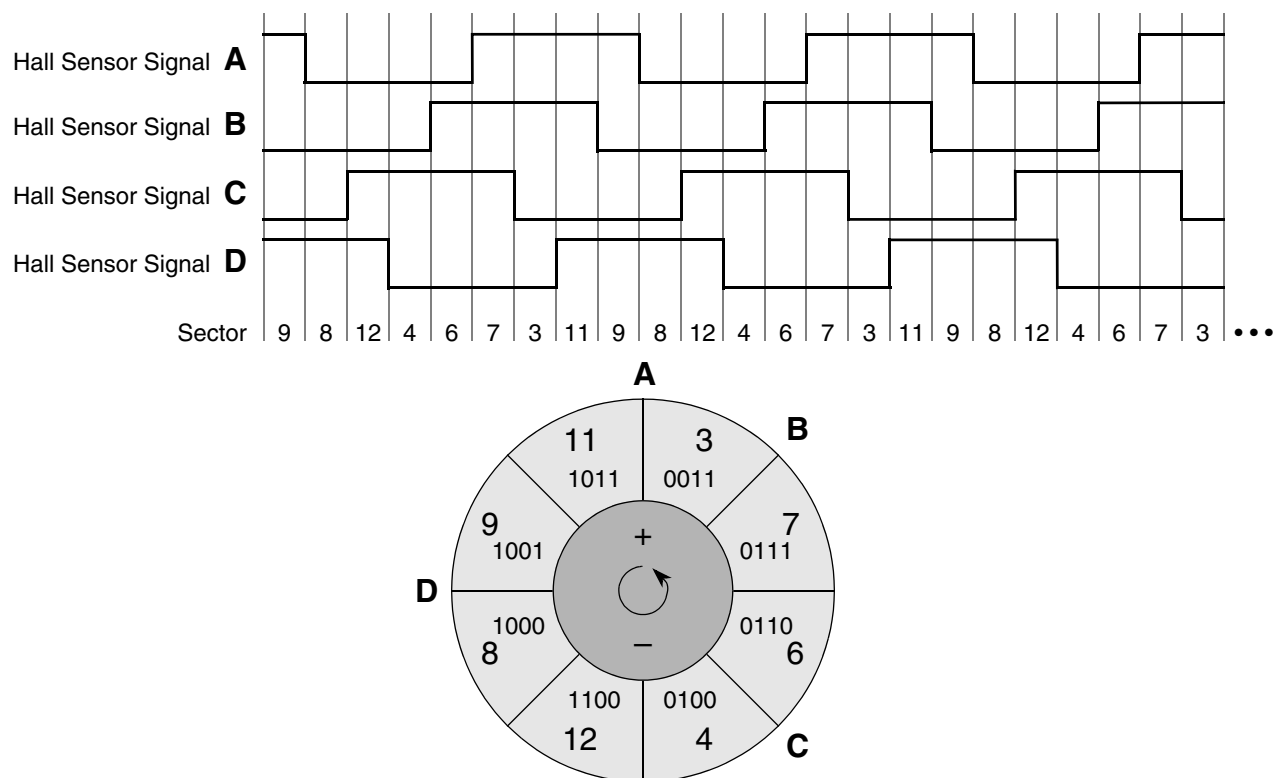

Figure 9. Pre-Defined Configurations: Four Phases - by 90 and 45 Deg

3.2 Commutation

The HD function has optional support for commutation capability using the PWM function. The user should create 1, 2, 3, or 4 commutation tables according to the number of HD phases and pass their pointers to the HD initialization function.

When an edge of any input Hall sensor signal is detected, a commutation command to one or more PWM phases is sent, and then the sector value is changed.

The commutation tables must be defined as structures of `uint32_t`. Each phase's commutation table consists of eight commutation commands. Each table entry is one commutation command.

The order of table entries is as follows:

- 1) Commutation command to execute on LH transition, on incremental direction, as first (`lh_i_0`).
- 2) Commutation command to execute on LH transition, on incremental direction, as second (`lh_i_1`).
- 3) Commutation command to execute on LH transition, on decremental direction, as first (`lh_d_0`).
- 4) Commutation command to execute on LH transition, on decremental direction, as second (`lh_d_1`).
- 5) Commutation command to execute on HL transition, on incremental direction, as first (`hl_i_0`).
- 6) Commutation command to execute on HL transition, on incremental direction, as second (`hl_i_1`).

Function Description

- 7) Commutation command to execute on HL transition, on decremental direction, as first (hl_d_0).
- 8) Commutation command to execute on HL transition, on decremental direction, as second (hl_d_1).

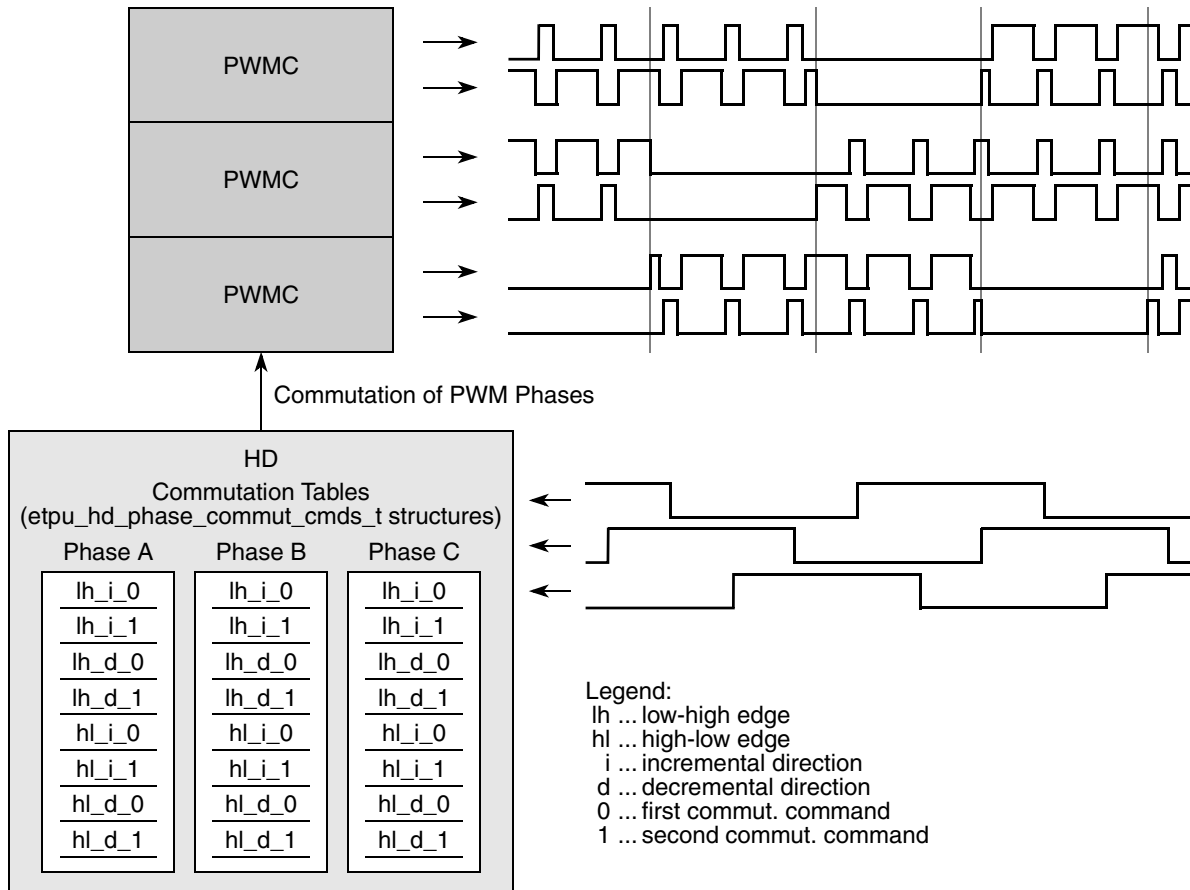

Figure 10. Commutation

Example of Commutation Tables definition:

```

#include "HD_etpu_gct.h" // defines channel numbers like PWM0_PHASEA_BASE_CHANNEL, ...
#include "etpu_hd.h" // defines phase commutation commands structure type etpu_hd_phase_commut_cmds_t
#include "etpu_pwm.h" // defines commutation commands and phase options

etpu_hd_phase_commut_cmds_t phaseA_commut_cmds = {
    (FS_ETPU_PWM_DUTY_POS<<24)+(FS_ETPU_PWM_OFF_LOW <<16)+(FS_ETPU_PWM_OFF_LOW <<8)+PWM0_PHASEB_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_NEG<<24)+(FS_ETPU_PWM_ON_ACTIVE_LOW<<16)+(FS_ETPU_PWM_ON_ACTIVE_HIGH<<8)+PWM0_PHASEA_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_NEG<<24)+(FS_ETPU_PWM_OFF_LOW <<16)+(FS_ETPU_PWM_OFF_LOW <<8)+PWM0_PHASEA_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_POS<<24)+(FS_ETPU_PWM_ON_ACTIVE_LOW<<16)+(FS_ETPU_PWM_ON_ACTIVE_HIGH<<8)+PWM0_PHASEB_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_NEG<<24)+(FS_ETPU_PWM_OFF_LOW <<16)+(FS_ETPU_PWM_OFF_LOW <<8)+PWM0_PHASEB_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_POS<<24)+(FS_ETPU_PWM_ON_ACTIVE_LOW<<16)+(FS_ETPU_PWM_ON_ACTIVE_HIGH<<8)+PWM0_PHASEA_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_POS<<24)+(FS_ETPU_PWM_OFF_LOW <<16)+(FS_ETPU_PWM_OFF_LOW <<8)+PWM0_PHASEA_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_NEG<<24)+(FS_ETPU_PWM_ON_ACTIVE_LOW<<16)+(FS_ETPU_PWM_ON_ACTIVE_HIGH<<8)+PWM0_PHASEB_BASE_CHANNEL
};

etpu_hd_phase_commut_cmds_t phaseB_commut_cmds = {
    (FS_ETPU_PWM_DUTY_POS<<24)+(FS_ETPU_PWM_OFF_LOW <<16)+(FS_ETPU_PWM_OFF_LOW <<8)+PWM0_PHASEC_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_NEG<<24)+(FS_ETPU_PWM_ON_ACTIVE_LOW<<16)+(FS_ETPU_PWM_ON_ACTIVE_HIGH<<8)+PWM0_PHASEB_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_NEG<<24)+(FS_ETPU_PWM_OFF_LOW <<16)+(FS_ETPU_PWM_OFF_LOW <<8)+PWM0_PHASEB_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_POS<<24)+(FS_ETPU_PWM_ON_ACTIVE_LOW<<16)+(FS_ETPU_PWM_ON_ACTIVE_HIGH<<8)+PWM0_PHASEC_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_POS<<24)+(FS_ETPU_PWM_OFF_LOW <<16)+(FS_ETPU_PWM_OFF_LOW <<8)+PWM0_PHASEC_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_NEG<<24)+(FS_ETPU_PWM_ON_ACTIVE_LOW<<16)+(FS_ETPU_PWM_ON_ACTIVE_HIGH<<8)+PWM0_PHASEB_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_NEG<<24)+(FS_ETPU_PWM_OFF_LOW <<16)+(FS_ETPU_PWM_OFF_LOW <<8)+PWM0_PHASEB_BASE_CHANNEL
};

etpu_hd_phase_commut_cmds_t phaseC_commut_cmds = {
    (FS_ETPU_PWM_DUTY_POS<<24)+(FS_ETPU_PWM_OFF_LOW <<16)+(FS_ETPU_PWM_OFF_LOW <<8)+PWM0_PHASEA_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_NEG<<24)+(FS_ETPU_PWM_ON_ACTIVE_LOW<<16)+(FS_ETPU_PWM_ON_ACTIVE_HIGH<<8)+PWM0_PHASEC_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_NEG<<24)+(FS_ETPU_PWM_OFF_LOW <<16)+(FS_ETPU_PWM_OFF_LOW <<8)+PWM0_PHASEC_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_POS<<24)+(FS_ETPU_PWM_ON_ACTIVE_LOW<<16)+(FS_ETPU_PWM_ON_ACTIVE_HIGH<<8)+PWM0_PHASEA_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_POS<<24)+(FS_ETPU_PWM_OFF_LOW <<16)+(FS_ETPU_PWM_OFF_LOW <<8)+PWM0_PHASEA_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_NEG<<24)+(FS_ETPU_PWM_ON_ACTIVE_LOW<<16)+(FS_ETPU_PWM_ON_ACTIVE_HIGH<<8)+PWM0_PHASEC_BASE_CHANNEL,
    (FS_ETPU_PWM_DUTY_NEG<<24)+(FS_ETPU_PWM_OFF_LOW <<16)+(FS_ETPU_PWM_OFF_LOW <<8)+PWM0_PHASEC_BASE_CHANNEL
};

```

Using the Hall Decoder (HD) eTPU Function, Rev. 0

3.3 Performance

Like all eTPU functions, the HD function performance in an application is to some extent dependent upon the service time (latency) of other active eTPU channels. This is due to the operational nature of the scheduler.

The influence of the HD function on the overall eTPU performance can be expressed by the following parameter:

- **maximum eTPU busy-time per sector**

This value determines the eTPU time necessary for processing one transition of a Hall sensor signal.

Table 1 lists the maximum eTPU busy-times per sector in eTPU cycles that depend on the mode of commutation processing. Where commutation processing is enabled, the value also covers the processing of two commutation commands performed by the PWMC function.

Table 1. Maximum eTPU Busy-Time per Sector

Commutation processing Mode	Maximum eTPU busy-time per sector [eTPU cycles]
Commutation processing disabled	63
Commutation processing enabled	227

The performance is influenced by compiler efficiency. The above numbers, measured on the code compiled by eTPU compiler version 1.0.115.990, are given for guidance only and are subject to change. For up to date information, refer to the information provided in the particular eTPU function set release available from Freescale.

4 C Level API for Function

The following routines provide the application developer easy access to the HD function. Use of these functions eliminates the need to directly control the eTPU registers. There are 24 functions added to the application programming interface (API). The routines can be found in the `etpu_hd.h` and `etpu_hd.c` files, which should be included in the link file along with the top level development file(s).

These routines will be described in order and are listed below:

- Initialization Functions:

```
int32_t fs_etpu_hd_init_1ph(      uint8_t channel_phaseA,
                                uint8_t timer,
                                uint8_t direction,
                                uint8_t PWM_chan,
                                etpu_hd_phase_commut_cmds_t *phaseA_commut_cmds)
```

```
int32_t fs_etpu_hd_init_2ph(      uint8_t channel_phaseA,
                                uint8_t channel_phaseB,
                                uint8_t timer,
                                uint8_t direction,
                                uint8_t PWMM_chan,
                                etpu_hd_phase_commut_cmds_t *phaseA_commut_cmds,
                                etpu_hd_phase_commut_cmds_t *phaseB_commut_cmds)
```

```
int32_t fs_etpu_hd_init_3ph60(  uint8_t channel_phaseA,
                                uint8_t channel_phaseB,
                                uint8_t channel_phaseC,
                                uint8_t timer,
                                uint8_t revolution_on_off,
                                uint8_t direction_on_off,
                                uint8_t direction,
                                uint8_t PWMM_chan,
                                etpu_hd_phase_commut_cmds_t *phaseA_commut_cmds,
                                etpu_hd_phase_commut_cmds_t *phaseB_commut_cmds,
                                etpu_hd_phase_commut_cmds_t *phaseC_commut_cmds)
```

```
int32_t fs_etpu_hd_init_3ph120( uint8_t channel_phaseA,
                                 uint8_t channel_phaseB,
                                 uint8_t channel_phaseC,
                                 uint8_t timer,
                                 uint8_t revolution_on_off,
                                 uint8_t direction_on_off,
                                 uint8_t direction,
                                 uint8_t PWMM_chan,
                                 etpu_hd_phase_commut_cmds_t *phaseA_commut_cmds,
                                 etpu_hd_phase_commut_cmds_t *phaseB_commut_cmds,
                                 etpu_hd_phase_commut_cmds_t *phaseC_commut_cmds)
```

```
int32_t fs_etpu_hd_init_4ph45(  uint8_t channel_phaseA,
                                uint8_t channel_phaseB,
                                uint8_t channel_phaseC,
                                uint8_t channel_phaseD,
                                uint8_t timer,
                                uint8_t revolution_on_off,
                                uint8_t direction_on_off,
                                uint8_t direction,
                                uint8_t PWMM_chan,
                                etpu_hd_phase_commut_cmds_t *phaseA_commut_cmds,
```

C Level API for Function

```
etpu_hd_phase_commut_cmds_t *phaseB_commut_cmds,  
etpu_hd_phase_commut_cmds_t *phaseC_commut_cmds,  
etpu_hd_phase_commut_cmds_t *phaseD_commut_cmds)
```

```
int32_t fs_etpu_hd_init_4ph90and45( uint8_t channel_phaseA,  
                                     uint8_t channel_phaseB,  
                                     uint8_t channel_phaseC,  
                                     uint8_t channel_phaseD,  
                                     uint8_t timer,  
                                     uint8_t revolution_on_off,  
                                     uint8_t direction_on_off,  
                                     uint8_t direction,  
                                     uint8_t PWMM_chan,  
                                     etpu_hd_phase_commut_cmds_t *phaseA_commut_cmds,  
                                     etpu_hd_phase_commut_cmds_t *phaseB_commut_cmds,  
                                     etpu_hd_phase_commut_cmds_t *phaseC_commut_cmds,  
                                     etpu_hd_phase_commut_cmds_t *phaseD_commut_cmds)
```

- Change Operation Functions:

```
int32_t fs_etpu_hd_enable_1ph( uint8_t channel_phaseA,  
                               uint8_t priority)  
int32_t fs_etpu_hd_enable_2ph( uint8_t channel_phaseA,  
                               uint8_t channel_phaseB,  
                               uint8_t priority)  
int32_t fs_etpu_hd_enable_3ph( uint8_t channel_phaseA,  
                               uint8_t channel_phaseB,  
                               uint8_t channel_phaseC,  
                               uint8_t priority)  
int32_t fs_etpu_hd_enable_4ph( uint8_t channel_phaseA,  
                               uint8_t channel_phaseB,  
                               uint8_t channel_phaseC,  
                               uint8_t channel_phaseD,  
                               uint8_t priority)  
int32_t fs_etpu_hd_set_commut_on ( uint8_t channel)  
int32_t fs_etpu_hd_set_commut_off( uint8_t channel)  
int32_t fs_etpu_hd_set_direction( uint8_t channel, uint8_t direction)  
int32_t fs_etpu_hd_reset_revolution_counter(uint8_t channel, int24_t value)  
int32_t fs_etpu_hd_disable( uint8_t channel)
```

- Value Return Functions:

```
etpu_hd_state_t* fs_etpu_hd_state_struct( uint8_t channel)  
uint8_t fs_etpu_hd_get_sector( uint8_t channel)
```

```

uint8_t fs_etpu_hd_get_direction( uint8_t channel)
int24_t fs_etpu_hd_get_revolution_counter( uint8_t channel)
int24_t fs_etpu_hd_get_revolution_period( uint8_t channel)
int24_t fs_etpu_hd_get_sector_period( uint8_t channel)
uint8_t fs_etpu_hd_get_pin_state( uint8_t channel)
int24_t* fs_etpu_hd_get_revolution_period_ptr( uint8_t channel)
int24_t* fs_etpu_hd_get_sector_period_ptr( uint8_t channel)

```

4.1 Initialization Function

4.1.1 `int32_t fs_etpu_hd_init_1ph(...)`, `int32_t fs_etpu_hd_init_2ph(...)`, `int32_t fs_etpu_hd_init_3ph60(...)`, `int32_t fs_etpu_hd_init_3ph120(...)`, `int32_t fs_etpu_hd_init_4ph45(...)`, `int32_t fs_etpu_hd_init_4ph90and45(...)`

These routines are used to initialize the eTPU channel(s) for the HD function(s). They differ in the number of phases they initialize (1, 2, 3, or 4 phases) and the configuration of the Hall sensors (by 60deg, by 120deg, by 45deg, or by 90 and 45 deg).

Because the Revolution Counter and Direction are calculated only in configurations with 3 or 4 input channels (phases), both the `revolution_on_off` and `direction_on_off` parameters are not used in `fs_etpu_hd_init_1ph(...)` and `fs_etpu_hd_init_2ph(...)` functions dedicated for one and two phases; see [Section 3, “Function Description.”](#)

The functions have the following parameters:

- **channel_phaseA (uint8_t)** - This is the Phase A channel number. This parameter should be assigned a value of 0-31 for ETPU_A, and 64-95 for ETPU_B.
- **channel_phaseB (uint8_t)** - This is the Phase B channel number. This parameter should be assigned a value of 0-31 for ETPU_A, and 64-95 for ETPU_B.
- **channel_phaseC (uint8_t)** - This is the Phase C channel number. This parameter should be assigned a value of 0-31 for ETPU_A, and 64-95 for ETPU_B.
- **channel_phaseD (uint8_t)** - This is the Phase D channel number. This parameter should be assigned a value of 0-31 for ETPU_A, and 64-95 for ETPU_B.
- **timer (uint8_t)** - This is the timer to use as a reference for the HD signals. This parameter should be assigned a value of:
 - FS_ETPU_TCR1
 - FS_ETPU_TCR2

- **revolution_on_off (int8_t)** - This parameter turns on/off the revolution counting. This parameter should be assigned a value of:
 - FS_ETPU_HD_REV_COUNTING_ON
 - FS_ETPU_HD_REV_COUNTING_OFF
- **direction_on_off (int8_t)** - This parameter turns on/off the automatic detection of motion system direction. This parameter should be assigned a value of:
 - FS_ETPU_HD_DIRECTION_AUTO_ON
 - FS_ETPU_HD_DIRECTION_AUTO_OFF
- **direction (int8_t)** - This parameter sets the initial motion system direction. This parameter should be assigned a value of:
 - FS_ETPU_HD_DIRECTION_INC
 - FS_ETPU_HD_DIRECTION_DEC
- **PWMM_chan (int8_t)** - This is the channel number of the PWMM channel (master channel). This parameter should be assigned a value of 0-31 for ETPU_A, and 64-95 for ETPU_B.
- ***phaseA_commut_cmds (etpu_hd_phase_commut_cmds_t)** - Pointer to the commutation table for phase A; `etpu_hd_phase_commut_cmds_t` structure type is defined in `etpu_hd.h` file. It is defined as a structure of eight `uint32_t` commutation commands.
- ***phaseB_commut_cmds (etpu_hd_phase_commut_cmds_t)** - Pointer to the commutation table for phase B; `etpu_hd_phase_commut_cmds_t` structure type is defined in `etpu_hd.h` file. It is defined as a structure of eight `uint32_t` commutation commands.
- ***phaseC_commut_cmds (etpu_hd_phase_commut_cmds_t)** - Pointer to the commutation table for phase C; `etpu_hd_phase_commut_cmds_t` structure type is defined in `etpu_hd.h` file. It is defined as a structure of eight `uint32_t` commutation commands.
- ***phaseD_commut_cmds (etpu_hd_phase_commut_cmds_t)** - Pointer to the commutation table for phase D; `etpu_hd_phase_commut_cmds_t` structure type is defined in `etpu_hd.h` file. It is defined as a structure of eight `uint32_t` commutation commands.

4.2 Change Operation Functions

4.2.1 `int32_t` **fs_etpu_hd_enable_1ph(...),**
 `int32_t` **fs_etpu_hd_enable_2ph(...),**
 `int32_t` **fs_etpu_hd_enable_3ph(...),**
 `int32_t` **fs_etpu_hd_enable_4ph(...)**

These routines are used to start initialized HD function(s). They differ in number of phases they initialize (1, 2, 3 or 4 phases). The following parameters are used in conjunction with these functions:

- **channel_phaseA (uint8_t)** - This is the Phase A channel number. This parameter should be assigned a value of 0-31 for ETPU_A, and 64-95 for ETPU_B.

- **channel_phaseB (uint8_t)** - This is the Phase B channel number. This parameter should be assigned a value of 0-31 for ETPU_A, and 64-95 for ETPU_B.
- **channel_phaseC (uint8_t)** - This is the Phase C channel number. This parameter should be assigned a value of 0-31 for ETPU_A, and 64-95 for ETPU_B.
- **channel_phaseD (uint8_t)** - This is the Phase D channel number. This parameter should be assigned a value of 0-31 for ETPU_A, and 64-95 for ETPU_B.
- **priority (uint8_t)** - This is the priority to assign to the HD function. This parameter should be assigned a value of:
 - FS_ETPU_PRIORITY_HIGH
 - FS_ETPU_PRIORITY_MIDDLE
 - FS_ETPU_PRIORITY_LOW

4.2.2 int32_t fs_etpu_hd_set_commut_on (uint8_t channel)

This function enables commutation processing on one HD channel. This function has the following parameter:

- **channel (uint8_t)** - This is the Phase A channel number. This parameter must be assigned the same value as was assigned to the *channel_phaseA* parameter in the initialization routine. If there are more HDs running simultaneously on the eTPU(s), the channel parameter distinguishes which HD function is accessed.

4.2.3 int32_t fs_etpu_hd_set_commut_off (uint8_t channel)

This function disables commutation processing on one HD channel. This function has the following parameter:

- **channel (uint8_t)** - This is the Phase A channel number. This parameter must be assigned the same value as was assigned to the *channel_phaseA* parameter in the initialization routine. If there are more HDs running simultaneously on the eTPU(s), the channel parameter distinguishes which HD function is accessed.

4.2.4 int32_t fs_etpu_hd_set_direction(uint8_t channel, uint8_t direction)

This function sets the Direction value. Use this function when the automatic direction detection is off (*direction_on_off*=ETPU_HD_DIRECTION_AUTO_OFF), in order to select which commutation command is used. This function has the following parameters:

- **channel (uint8_t)** - This is the Phase A channel number. This parameter must be assigned the same value as was assigned to the *channel_phaseA* parameter in the initialization routine. If there are more HDs running simultaneously on the eTPU(s), the channel parameter distinguishes which HD function is accessed.

- **direction (uint8_t)** - This parameter should be assigned a value of:
 - ETPU_HD_DIRECTION_INC
 - ETPU_HD_DIRECTION_DEC

4.2.5 int32_t fs_etpu_hd_reset_revolution_counter(uint8_t channel, int24_t value)

This function changes the Revolution Counter value. This function has the following parameters:

- **channel (uint8_t)** - This is the Phase A channel number. This parameter must be assigned the same value as was assigned to the *channel_phaseA* parameter in the initialization routine. If there are more HDs running simultaneously on the eTPU(s), the channel parameter distinguishes which HD function is accessed.
- **value (int24_t)** - This is the Revolution Counter value to be set.

4.2.6 int32_t fs_etpu_hd_disable(uint8_t channel)

This function disables one HD channel. This function has the following parameter:

- **channel (uint8_t)** - This is the Phase A channel number. This parameter must be assigned the same value as was assigned to the *channel_phaseA* parameter in the initialization routine. If there are more HDs running simultaneously on the eTPU(s), the channel parameter distinguishes which HD function is accessed.

4.3 Value Return Function

4.3.1 etpu_hd_state_t* fs_etpu_hd_state_struct(uint8_t channel)

This function returns the pointer to the state structure. This function has the following parameter:

- **channel (uint8_t)** - This is the Phase A channel number. This parameter must be assigned the same value as was assigned to the *channel_phaseA* parameter in the initialization routine. If there are more HDs running simultaneously on the eTPU(s), the channel parameter distinguishes which HD function is accessed.

4.3.2 uint8_t fs_etpu_hd_get_sector(uint8_t channel)

This function returns the current Sector Value. This function has the following parameter:

- **channel (uint8_t)** - This is the Phase A channel number. This parameter must be assigned the same value as was assigned to the *channel_phaseA* parameter in the initialization routine. If there are more HDs running simultaneously on the eTPU(s), the channel parameter distinguishes which HD function is accessed.

The Sector value is returned as an `uint8_t`.

4.3.3 `uint8_t fs_etpu_hd_get_direction(uint8_t channel)`

This function returns the motion system direction. This function has the following parameter:

- **channel (uint8_t)** - This is the Phase A channel number. This parameter must be assigned the same value as was assigned to the *channel_phaseA* parameter in the initialization routine. If there are more HDs running simultaneously on the eTPU(s), the channel parameter distinguishes which HD function is accessed.

The returned value can be one of:

- `ETPU_HD_DIRECTION_INC`
- `ETPU_HD_DIRECTION_DEC`

4.3.4 `int24_t fs_etpu_hd_get_revolution_counter(uint8_t channel)`

This function returns the Revolution Counter value. This function has the following parameter:

- **channel (uint8_t)** - This is the Phase A channel number. This parameter must be assigned the same value as was assigned to the *channel_phaseA* parameter in the initialization routine. If there are more HDs running simultaneously on the eTPU(s), the channel parameter distinguishes which HD function is accessed.

The Revolution Counter value is returned as an `int24_t`.

4.3.5 `int24_t fs_etpu_hd_get_revolution_period(uint8_t channel)`

This function returns the Revolution Period value. This function has the following parameter:

- **channel (uint8_t)** - This is the Phase A channel number. This parameter must be assigned the same value as was assigned to the *channel_phaseA* parameter in the initialization routine. If there are more HDs running simultaneously on the eTPU(s), the channel parameter distinguishes which HD function is accessed.

The Revolution Period value is returned as an `int24_t`.

4.3.6 `int24_t fs_etpu_hd_get_sector_period(uint8_t channel)`

This function returns the Sector Period value. This function has the following parameter:

- **channel (uint8_t)** - This is the Phase A channel number. This parameter must be assigned the same value as was assigned to the *channel_phaseA* parameter in the initialization routine. If there are more HDs running simultaneously on the eTPU(s), the channel parameter distinguishes which HD function is accessed.

The Sector Period value is returned as an `int24_t`.

4.3.7 uint8_t fs_etpu_hd_get_pin_state(uint8_t channel)

This function returns selected HD channel pin state. This function has the following parameter:

- **channel (uint8_t)** - This is the Phase A channel number. This parameter must be assigned the same value as was assigned to the *channel_phaseA* parameter in the initialization routine. If there are more HDs running simultaneously on the eTPU(s), the channel parameter distinguishes which HD function is accessed.

The HD channel pin state value is returned as an `uint8_t`.

4.4 TPU-Compatible C Level API for Function

The TPU-compatible API provides backward-compatibility from eTPU to TPU. The following functions allow control of the eTPU HD function using the TPU HALLD API function calls.

- Initialization Function:

```
void tpu_halld_init(struct TPU3_tag *tpu,
                  UINT8 channel,
                  INT16 direction,
                  INT16 state_no_address,
                  UINT8 mode)
```

- Change Operation Functions:

```
void tpu_halld_enable(struct TPU3_tag *tpu,
                    UINT8 channel,
                    UINT8 priority)
void tpu_halld_disable(struct TPU3_tag *tpu,
                     UINT8 channel)
void tpu_halld_set_direction(struct TPU3_tag *tpu,
                           UINT8 channel,
                           INT16 direction)
```

- Value Return Functions:

```
INT16 tpu_halld_get_state_no(struct TPU3_tag *tpu,
                            UINT8 channel)
INT16 tpu_halld_get_pinstate(struct TPU3_tag *tpu,
                             UINT8 channel)
```

NOTE

`tpu_halld_set_state_no_address(...)` function is not implemented!

5 Example Use of Function

5.1 Demo Application

The usage of the HD eTPU function is demonstrated in the application note "3-Phase BLDC Motor Demo Application With Speed Closed Loop". For a detailed description of the demo, refer to AN2892.

The HD function is initialized in configuration with three phases and HD sensors by 120 degrees. Direction and revolution counting is enabled.

5.1.1 Function Calls

```

/* initialize the HD function */
err_code = fs_etpu_hd_init_3ph120 (
    HD0_PHASEA, /* engine: A; channel: 0 */
    HD0_PHASEB, /* engine: A; channel: 1 */
    HD0_PHASEC, /* engine: A; channel: 2 */
    FS_ETPU_TCR1, /* timer: TCR1 */
    FS_ETPU_HD_REV_COUNTING_ON, /*revolution_on_off: revolutions are counted*/
    FS_ETPU_HD_DIRECTION_AUTO_ON, /*direction_on_off: direction is calculated */
    FS_ETPU_HD_DIRECTION_INC, /* direction: initial direction INC */
    &phaseA_commut_cmds, /* phaseA Commutation Table address */
    &phaseB_commut_cmds, /* phaseB Commutation Table address */
    &phaseC_commut_cmds); /* phaseC Commutation Table address */

/* enable the HD function */
fs_etpu_hd_enable_3ph(
    HD0_PHASEA, /* engine: A; channel: 0 */
    HD0_PHASEB, /* engine: A; channel: 1 */
    HD0_PHASEC, /* engine: A; channel: 2 */
    FS_ETPU_PRIORITY_MIDDLE); /* priority: Middle */

/* enable commutations by HD signals */
fs_etpu_hd_set_commut_on(HD0_PHASEA);
fs_etpu_hd_set_commut_on(HD0_PHASEB);
fs_etpu_hd_set_commut_on(HD0_PHASEC);

```

6 Summary and Conclusions

This application note provides the user with a description of the Hall Decoder (HD) eTPU function usage and examples. The simple C interface routines to the HD eTPU function enable easy implementation of the HD in applications. The demo application is targeted at the MCF523x family of devices, but it could be easily reused with any device that has an eTPU.
