

High Speed Quad MOSFET Driver

Features

- ▶ 6.0ns rise and fall time with 1000pF load
- ▶ 2.0A peak output source/sink current
- ▶ 1.2 to 5.0V input CMOS compatible
- ▶ 5.0 to 12V total supply voltage
- ▶ Smart logic threshold
- ▶ Low jitter design
- ▶ Four matched channels
- ▶ Outputs can swing below ground
- ▶ Output is high impedance when disabled
- ▶ Low inductance package
- ▶ High-performance thermally-enhanced

Applications

- ▶ Medical ultrasound imaging
- ▶ Piezoelectric transducer drivers
- ▶ Nondestructive evaluation
- ▶ PIN diode driver
- ▶ CCD Clock driver/buffer
- ▶ High speed level translator

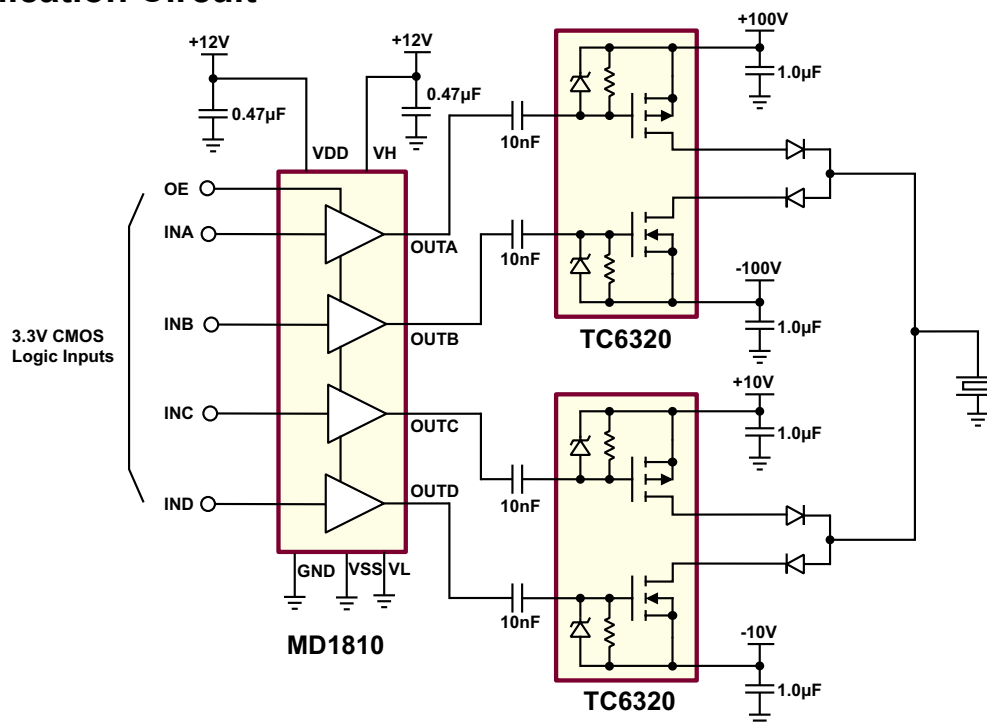

General Description

The Supertex MD1810 is a high-speed quad MOSFET driver. It is designed to drive high voltage P- and N-channel MOSFETs for medical ultrasound imaging applications. The MD1810 can also be used for ultrasound metal flaw detection, nondestructive evaluation test, piezoelectric transducer drive, clock drive, and PIN diode drive.

The MD1810 has four inputs which individually control four outputs. It also has an output enable (OE) pin. When OE is low, all of the outputs will be in a high impedance state regardless of their logic input control. When OE is high, the MD1810 sets the threshold logic transition to $(V_{OE} + V_{GND})/2$. This ensures the transition to always be at half the amplitude of the logic input signal. This allows the device to have inherent propagation delay matching regardless of the logic input amplitude.

The output stage of the MD1810 has separate power connections enabling the output signal L and H levels to be chosen independently from the V_{DD} and V_{SS} supply voltages. As an example, the input logic levels may be 0 and 1.8 volts, the control logic may be powered by +5.0 and -5.0 volts, and the output L and H levels may be varied anywhere over the range of -5.0 to +5.0 volts. The output stage is capable of peak currents of up to ± 2.0 amps, depending on the supply voltages used and load capacitance present.

Typical Application Circuit

Ordering Information

Device	16-Lead QFN 4x4mm body, 1.00mm height (max), 0.65mm pitch
MD1810	MD1810K6-G

-G indicates package is RoHS compliant ("Green")

ESD Sensitive Device

Absolute Maximum Ratings

Parameter	Value
$V_{DD} - V_{SS}$, Logic supply voltage	-0.5V to +13.5V
V_H , Output high supply voltage	$V_L - 0.5V$ to $V_{DD} + 0.5V$
V_L , Output low supply voltage	$V_{SS} - 0.5V$ to $V_H + 0.5V$
V_{SS} , Low side supply voltage	-7.0V to +0.5V
Logic input levels	$V_{SS} - 0.5V$ to GND +7V
Maximum junction temperature	+125°C
Storage temperature	-65°C to 150°C
Soldering temperature	235°C
Package power dissipation	2.2W
Thermal resistance (θ_{JA})*	45°C/W

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

DC Electrical Characteristics ($V_H = V_{DD} = 12V$, $V_L = V_{SS} = GND = 0V$, $V_{OE} = 3.3V$, $T_A = 25^\circ C$)

Sym	Parameter	Min	Typ	Max	Units	Conditions
$V_{DD} - V_{SS}$	Logic supply voltage	4.5	-	13	V	---
V_{SS}	Low side supply voltage	-5.5	-	0	V	---
V_H	Output high supply voltage	$V_{SS} + 2$	-	V_{DD}	V	---
V_L	Output low supply voltage	V_{SS}	-	$V_{DD} - 2$	V	---
I_{DDQ}	V_{DD} quiescent current	-	0.8	-	mA	No input transitions, OE = 1
I_{HQ}	V_H quiescent current	-	-	10	μA	
I_{DD}	V_{DD} average current	-	7.0	-	mA	One channel on at 5.0Mhz, No load
I_H	V_H average current	-	18	-	mA	
V_{IH}	Input logic voltage high	$V_{OE} - 0.3$	-	5.0	V	For logic inputs INA, INB, INC, and IND
V_{IL}	Input logic voltage low	0	-	0.3	V	
I_{IH}	Input logic current high	-	-	1.0	μA	
I_{IL}	Input logic current low	-	-	1.0	μA	
V_{IH}	OE input logic voltage high	1.2	-	5	V	For logic input OE
V_{IL}	OE input logic voltage low	0	-	0.3	V	
R_{IN}	Input logic impedance to GND	12	20	30	K Ω	
C_{IN}	Logic input capacitance	-	5.0	10	pF	---

DC Electrical Characteristics (cont.) ($V_H = V_{DD} = 12V$, $V_L = V_{SS} = GND = 0V$, $V_{OE} = 3.3V$, $T_A = 25^\circ C$)

Sym	Parameter	Min	Typ	Max	Units	Conditions
R_{SINK}	Output sink resistance	-	-	12.5	Ω	$I_{SINK} = 50mA$
R_{SOURCE}	Output source resistance	-	-	12.5	Ω	$I_{SOURCE} = 50mA$
I_{SINK}	Peak output sink current	-	2.0	-	A	---
I_{SOURCE}	Peak output source current	-	2.0	-	A	---

AC Electrical Characteristics ($V_H = V_{DD} = 12V$, $V_L = V_{SS} = GND = 0V$, $V_{OE} = 3.3V$, $T_A = 25^\circ C$)

Sym	Parameter	Min	Typ	Max	Units	Conditions
t_{irf}	Input or OE rise & fall time	-	-	10	ns	Logic input edge speed requirement
t_{PLH}	Propagation delay when output is from low to high	-	7.0	-	ns	$C_{LOAD} = 1000pF$, see timing diagram Input signal rise/fall time 2.0ns
t_{PHL}	Propagation delay when output is from high to low	-	7.0	-	ns	
t_{POE}	Propagation delay OE to output	-	9.0	-	ns	
t_r	Output rise time	-	6.0	-	ns	
t_f	Output fall time	-	6.0	-	ns	
$ t_r - t_f $	Rise and fall time matching	-	1.0	-	ns	For each channel
$ t_{PLH} - t_{PHL} $	Propagation low to high and high to low matching	-	1.0	-	ns	
Δt_{dm}	Propagation delay matching	-	± 2.0	-	ns	Device to device delay match

Typical Applications

2-Channel +100V to -100V Pulser

Single Channel ±100V to 0V Pulser

Application Information

For proper operation of the MD1810, low inductance bypass capacitors should be used on the various supply pins. The GND pin should be connected to the logic ground. The INA, INB, INC, IND, and OE pins should be connected to a logic source with a swing of GND to V_{LL} , where V_{LL} is 1.2 to 5.0 volts. Good trace practices should be followed corresponding to the desired operating speed. The internal circuitry of the MD1810 is capable of operating up to 100MHz, with the primary speed limitation being the loading effects of the load capacitance. Because of this speed and the high transient currents that result with capacitive loads, the bypass capacitors should be as close to the chip pins as possible. Unless the load specifically requires bipolar drive, the V_{SS} and V_L pins should have low inductance feed-through connections directly to a ground plane. If these voltages are not zero, then they need bypass capacitors in a manner similar to the positive power supplies. The power connection V_{DD} should have a ceramic bypass capacitor to the ground plane with short leads and decoupling components to prevent resonance in the power leads.

The voltages of VH and VL decide the output signal levels. These two pins can draw fast transient currents of up to 2.0A, so they should be provided with an appropriate bypass capacitor located next to the chip pins. A ceramic capacitor

of up to 1.0 μ F may be appropriate, with a series ferrite bead to prevent resonance in the power supply lead coming to the capacitor. Pay particular attention to minimizing trace lengths, current loop area and using sufficient trace width to reduce inductance. Surface mount components are highly recommended. Since the output impedance of this driver is very low, in some cases it may be desirable to add a small series resistance in series with the output signal to obtain better waveform transitions at the load terminals. This will of course reduce the output voltage slew rate at the terminals of a capacitive load.

Pay particular attention that parasitic couplings are minimized from the output to the input signal terminals. The parasitic feedback may cause oscillations or spurious waveform shapes on the edges of signal transitions. Since the input operates with signals down to 1.2V even small coupled voltages may cause problems. Use of a solid ground plane and good power and signal layout practices will prevent this problem. Be careful that a circulating ground return current from a capacitive load cannot react with common inductance to cause noise voltages in the input logic circuitry.

Pin Description

Pin #	Function	Description
1	INB	Logic input. Input logic high will cause the output to swing to VH. Input logic low will cause the output to swing to VL. Keep all logic inputs low until IC powered up.
2	VL	Supply voltage for N-channel output stage.
3	GND	Logic input ground reference.
4	VL	Supply voltage for N-channel output stage.
5	INC	Logic input. Input logic high will cause the output to swing to VH. Input logic low will cause the output to swing to VL. Keep all logic inputs low until IC powered up.
6	IND	
7	VSS	Low side supply voltage. VSS is also connected to the IC substrate. It is required to connect to the most negative potential of voltage supplies and powered-up first.
8	OUTD	Output drivers
9	OUTC	
10, 11	VH	Supply voltage for P-channel output stage.
12	OUTB	Output drivers
13	OUTA	
14	VDD	High side supply voltage.
15	INA	Logic input. Input logic high will cause the output to swing to VH. Input logic low will cause the output to swing to VL. Keep all logic inputs low until IC powered up.
16	OE	Output enable logic input. When OE is high, $(V_{OE} + V_{GND})/2$ sets the threshold transition between logic level high and low. When OE is low, all outputs are at high impedance. Keep OE low until IC powered up.
Substrate		The IC substrate is internally connected to the thermal pad. Thermal pad and VSS must be connected externally.

Notes:

- Details of Pin 1 identifier are optional, but must be located within the indicated area. The Pin 1 identifier may be either a mold, or an embedded metal or marked feature.
- Depending on the method of manufacturing, a maximum of 0.15mm pullback (L1) may be present.
- The inner tip of the lead may be either rounded or square.
