## 1. GENERAL DESCRIPTION

www.DataSheet4U.com

SSD1859 is a single-chip CMOS LCD driver with controller for liquid crystal dot-matrix graphic display system. SSD1859 consists of 210 high voltage driving output pins for driving 128 Segments and 80 Commons and 1 icon line.

SSD1859 display data directly from its internal 128x81x2 bits Graphic Display Data RAM (GDDRAM). Data/Commands are sent from general MCU through hardware selectable 6800-/8080-series compatible Parallel Interface or 3/4 wires Serial Peripheral Interface.

SSD1859 embeds a DC-DC Converter, a LCD Voltage Regulator, an On-Chip Bias Divider, integrated bias capacitors, integrated booster capacitors and an On-Chip Oscillator, which reduce the number of external components. With the special design on minimizing power consumption and die/package layout, SSD1859 is suitable for any portable battery-driven applications requiring long operation period and compact size.

## 2. FEATURES

128x80 + 1 icon line, 4 gray-levels Graphic Display  
Programmable Multiplex ratio [16Mux - 81Mux]  
Single Supply Operation, 1.8 V - 3.3V  
Low Current Sleep Mode  
On-Chip Voltage Generator / External Power Supply  
Software selectable 3X / 4X / 5X / 6X On-Chip DC-DC Converter  
On-Chip Oscillator  
On-Chip Bias Dividers  
Programmable 1/4, 1/5, 1/6, 1/7, 1/8, 1/9 and 1/10 bias ratio  
Maximum +15.0V LCD Driving Output Voltage  
Hardware pin selectable for 8-bit 6800-series Parallel Interface, 8-bit 8080-series Parallel Interface, 3-wire Serial Peripheral Interface or 4-wire Serial Peripheral Interface  
On-Chip 128x81x2 Graphic Display Data RAM  
Re-mapping of Row and Column Drivers  
Vertical Scrolling  
Display Offset Control  
64 Level Internal Contrast Control  
External Contrast Control  
Integrated Cap  
Maximum 15MHz SPI or 18MHz PPI (8 bit) operation  
Selectable LCD Driving Voltage Temperature Coefficients (2 settings)  
Available in Gold Bump Die

## 3. ORDERING INFORMATION

Ordering Part Number	SEG	COM	Package Form	Reference	Remark
SSD1859Z	128	80 + 1	Gold Bump Die	Figure 2 on Page 7	-

Table 1 - Ordering Information

#### 4. BLOCK DIAGRAM

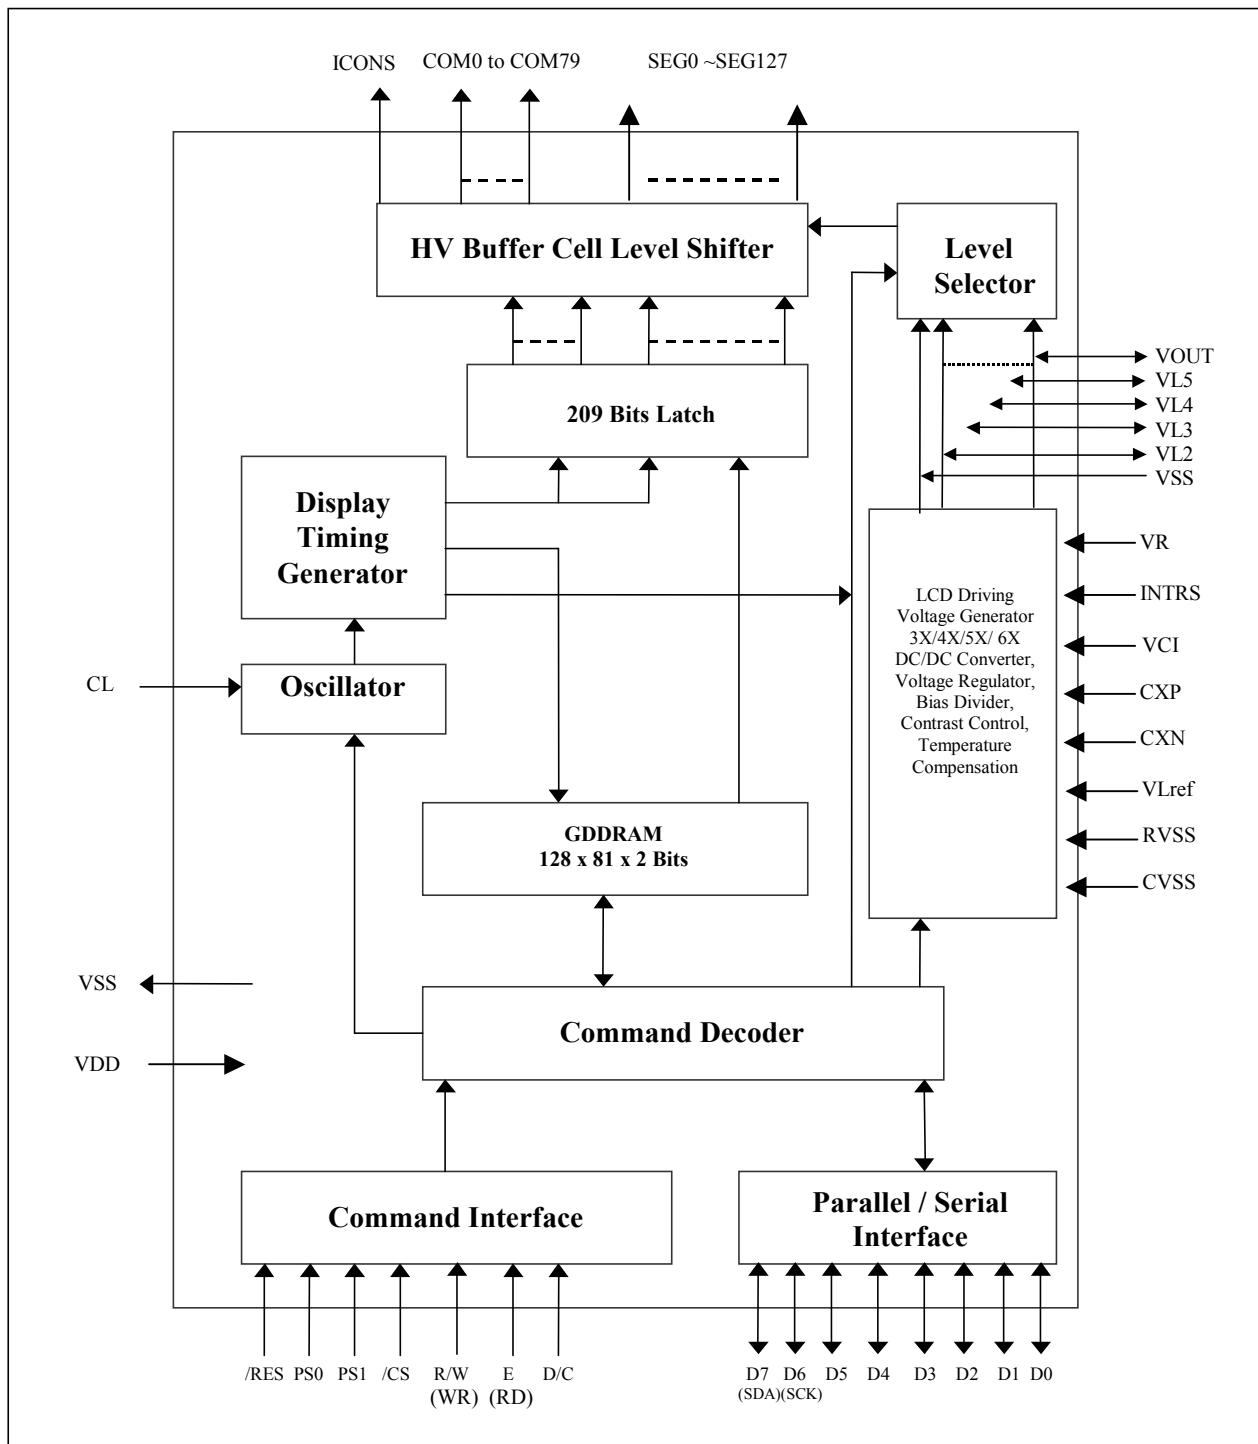

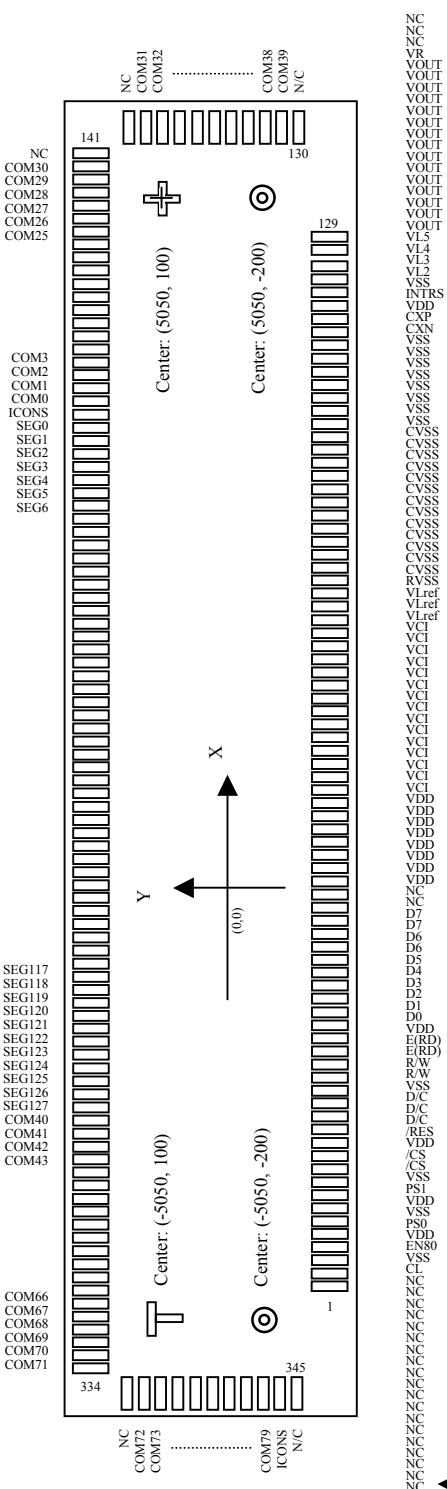

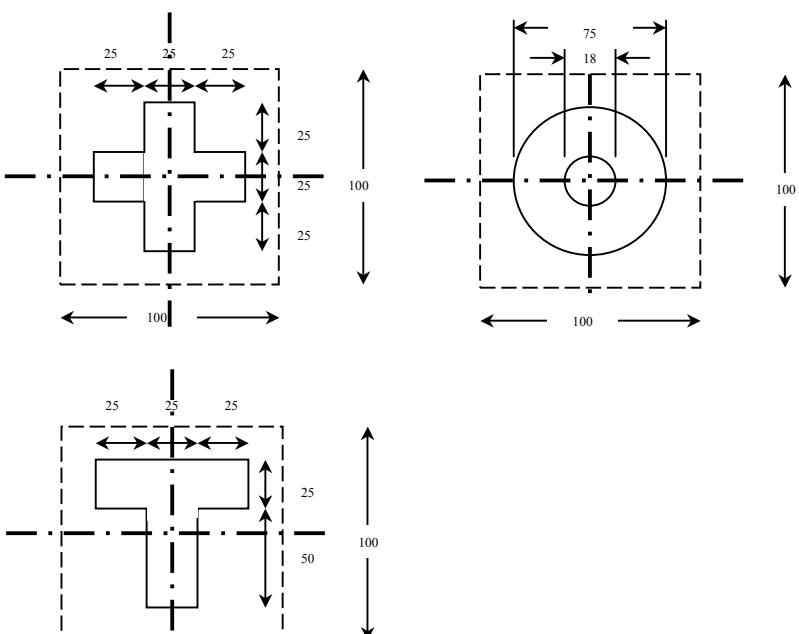

Figure 1 - SSD1859 Block Diagram

## 5. DIE PAD ARRANGEMENT (SSD1859Z DIE PIN ASSIGNMENT)

### Note:

1. The gold bumps face up in this diagram.
  2. Coordinates reference to center of the chip.
  3. All dimensions and coordinates in um.
  4. All alignment keys do not contain gold bump.

Die Size: 10915um x 1015um

Die Size: 1051mm  
Die Thickness: 21mil

Bump Height: Typical 18 $\mu$ m

Bump coplanarity <3μm (within die)

Bump Size:

Pad 1-129:	56 x 56um
Pad 130-140,335-345:	82 x 36um
Pad 142-333:	36 x 82um
Pad 141,334:	56 x 82um

## 6. PIN DESCRIPTIONS

### **RES**

This pin is reset signal input. When the pin is low, initialization of the chip is executed.

### **PS0, PS1**

PS0 and PS1 determine the interface protocol between the driver and MCU. Refer to the following table for details.

PS0	PS1	Interface
L	L	3-wire SPI (write only)
L	H	4-wire SPI (write only)
H	L	8080 parallel interface (read and write allowed)
H	H	6800 parallel interface (read and write allowed)

### **CS**

This pin is chip select input. The chip is enabled for display data/command transfer only when  $\overline{CS}$  is low.

### **D / $\overline{C}$**

This input pin is to identify display data/command cycle. When the pin is high, the data written to the driver will be written into display RAM. When the pin is low, the data will be interpreted as command. This pin must be connected to VSS when 3-lines SPI interface is used.

### **R/W ( $\overline{WR}$ )**

This pin is microprocessor interface signal. When 6800 interface mode is selected (by PS0 and PS1), the signal indicates read mode when high and write mode when low. When 8080 interface mode is selected (by PS0 and PS1), a data write operation is initiated when R/W(  $\overline{WR}$  ) is low and the chip is selected.

### **E( $\overline{RD}$ )**

This pin is microprocessor interface signal. When 6800 interface mode is selected (by PS0 and PS1), a data operation is initiated when E(  $\overline{RD}$  ) is high and the chip is selected. When 8080 interface mode is selected (PS0 and PS1), a data read operation is initiated when E(  $\overline{RD}$  ) is low and the chip is selected.

### **D0-D7**

These pins are 8-bit bi-directional data/command bus to be connected to the microprocessor's data bus. When serial mode is selected, D7 is the serial data input SDA and D6 is the serial clock input SCK.

### **INTRS**

This pin is an input pin to enable the internal resistor network for the voltage regulator when INTRS is high. When external regulator is used, this pin must be connected to VSS, and external resistor R1/R2 should be connected to VOUT, VR and VSS.

### **VDD**

This pin is power supply.

### **VSS**

This is a logic ground pin. It must connect to GND from external supply.

**RVSS**

This pin is the ground for internal voltage regulator. It must connect to same external GND of CVSS.

**CVSS**

This is an analog ground pin. It must connect to GND from external supply.

**VLref**

This pin is the reference voltage for internal operational amplifiers. It must connect to VCI / VSS depends on the panel loading.

**VCI**

Reference voltage input for internal DC-DC converter. The voltage of generated VOUT equals to the multiple factor (2X, 3X, 4X, 5X or 6X) times VCI with respect to VSS.

Note: voltage at this input pin must be larger than or equal to VDD.

**CXP, CXN**

Connect an external capacitor to these pins when 6X DC-DC Converter Factor is set.

**VOUT**

This pin is the most positive LCD driving voltage. It can be supplied externally or generated by the internal regulator.

**VR**

This pin is an input of the internal voltage regulator. When the internal resistors network for the voltage regulator is disabled (INTRS is pulled low), external resistors should be connected between VSS and VR, and VR and VOUT, respectively (Please refer to application example on page 42).

**VL5, VL4, VL3 and VL2**

These are LCD driving voltages. These pins should NOT be connected to any signal pins nor shorted together. They should be left open. They have the following relationship:

$VOUT > VL5 > VL4 > VL3 > VL2 > VSS$

	1:a bias
VL5	$(a-1)/a * VOUT$
VL4	$(a-2)/a * VOUT$
VL3	$2/a * VOUT$
VL2	$1/a * VOUT$

**COM0 - COM79**

These pins provide the row driving signal COM0 - COM79 to the LCD panel.

**ICONS**

This pin is the special icon line COM signal output.

**SEG0 - SEG127**

These pins provide the LCD column driving signal. Their voltage level is VSS during sleep mode and standby mode.

**CL**

This pin is the external clock input for the device if external clock mode is selected by software command. Under POR operation, this pin should be left opened and internal oscillator will be used after power on reset.

**EN80**

This pin must be connected to VDD.

[www.DataSheet4U.com](http://www.DataSheet4U.com)

**NC**

These No Connection pins should NOT be connected to any signal pins nor shorted together. They should be left open.

## 7. FUNCTIONAL BLOCK DESCRIPTIONS

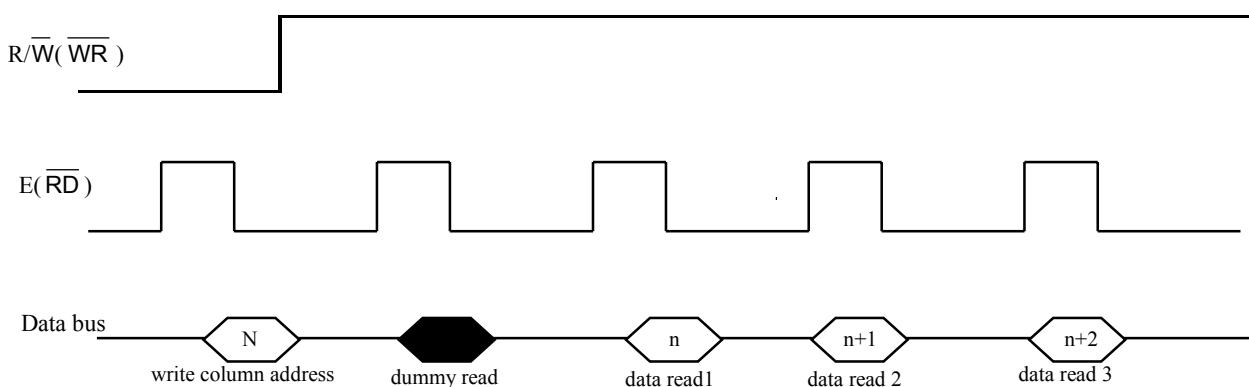

### Command Decoder and Command Interface

This module determines whether the input data is interpreted as data or command. Data is directed to this module based upon the input of the D/C pin. If D/C is high, data is written to Graphic Display Data RAM (GDDRAM). If D/C is low, the input at D0-D7 is interpreted as a Command and it will be decoded and written to the corresponding command register.

Reset is the same function as Power ON Reset (POR). Once RES receives a negative reset pulse of about 1us, all internal circuitry will be back to its initial status. Refer to Command Description section for more information.

### MPU Parallel 6800-series Interface

The parallel interface consists of 8 bi-directional data pins (D0-D7), R/W(WR), D/C, E(RD) and CS. R/W(WR) input High indicates a read operation from the Graphic Display Data RAM (GDDRAM) or the status register. R/W(WR) input Low indicates a write operation to Display Data RAM or Internal Command Registers depending on the status of D/C input. The E(RD) and CS input serves as data latch signal (clock) when they are high and low respectively. Refer to Figure 10 and 11 of parallel timing characteristics for Parallel Interface Timing Diagram of 6800-series microprocessors. In order to match the operating frequency of display RAM with that of the microprocessor, pipeline processing is internally performed which requires the insertion of a dummy read before the first actual display data read. This is shown in Figure 3 below.

**Figure 3 - Display data read with the insertion of dummy read**

### MPU Parallel 8080-series interface

The parallel interface consists of 8 bi-directional data pins (D0-D7), R/W(WR), E(RD), D/C and CS. The CS input serves as data latch signal (clock) when it is low. Whether it is display data or status register read is controlled by D/C. R/W(WR) and E(RD) input indicate a write or read cycle when CS is low. Refer to P.34, Figure 12 and 13 of parallel timing characteristics for Parallel Interface Timing Diagram of 8080-series microprocessor.

Similar to 6800-series interface, a dummy read is also required before the first actual display data read.

## MPU Serial 4-wire Interface

www.DataSheet4U.com

The serial interface consists of serial clock SCK, serial data SDA, D/C and CS. Input to SDA is shifted into a 8-bit shift register on every rising edge of SCK in the order of D<sub>7</sub>, D<sub>6</sub>,...D<sub>0</sub>. D/C is sampled on every eighth clock and the content in the shift register is written to the Display Data RAM or command register in the same clock. No extra clock or command is required to end the transmission.

## MPU Serial 3-wire Interface

Operation is similar to 4-wire serial interface except D/C is not used. The Set Display Data Length command is used to indicate that a specified number display data byte (1-256) is to be transmitted. Next byte after the display data string is handled as a command.

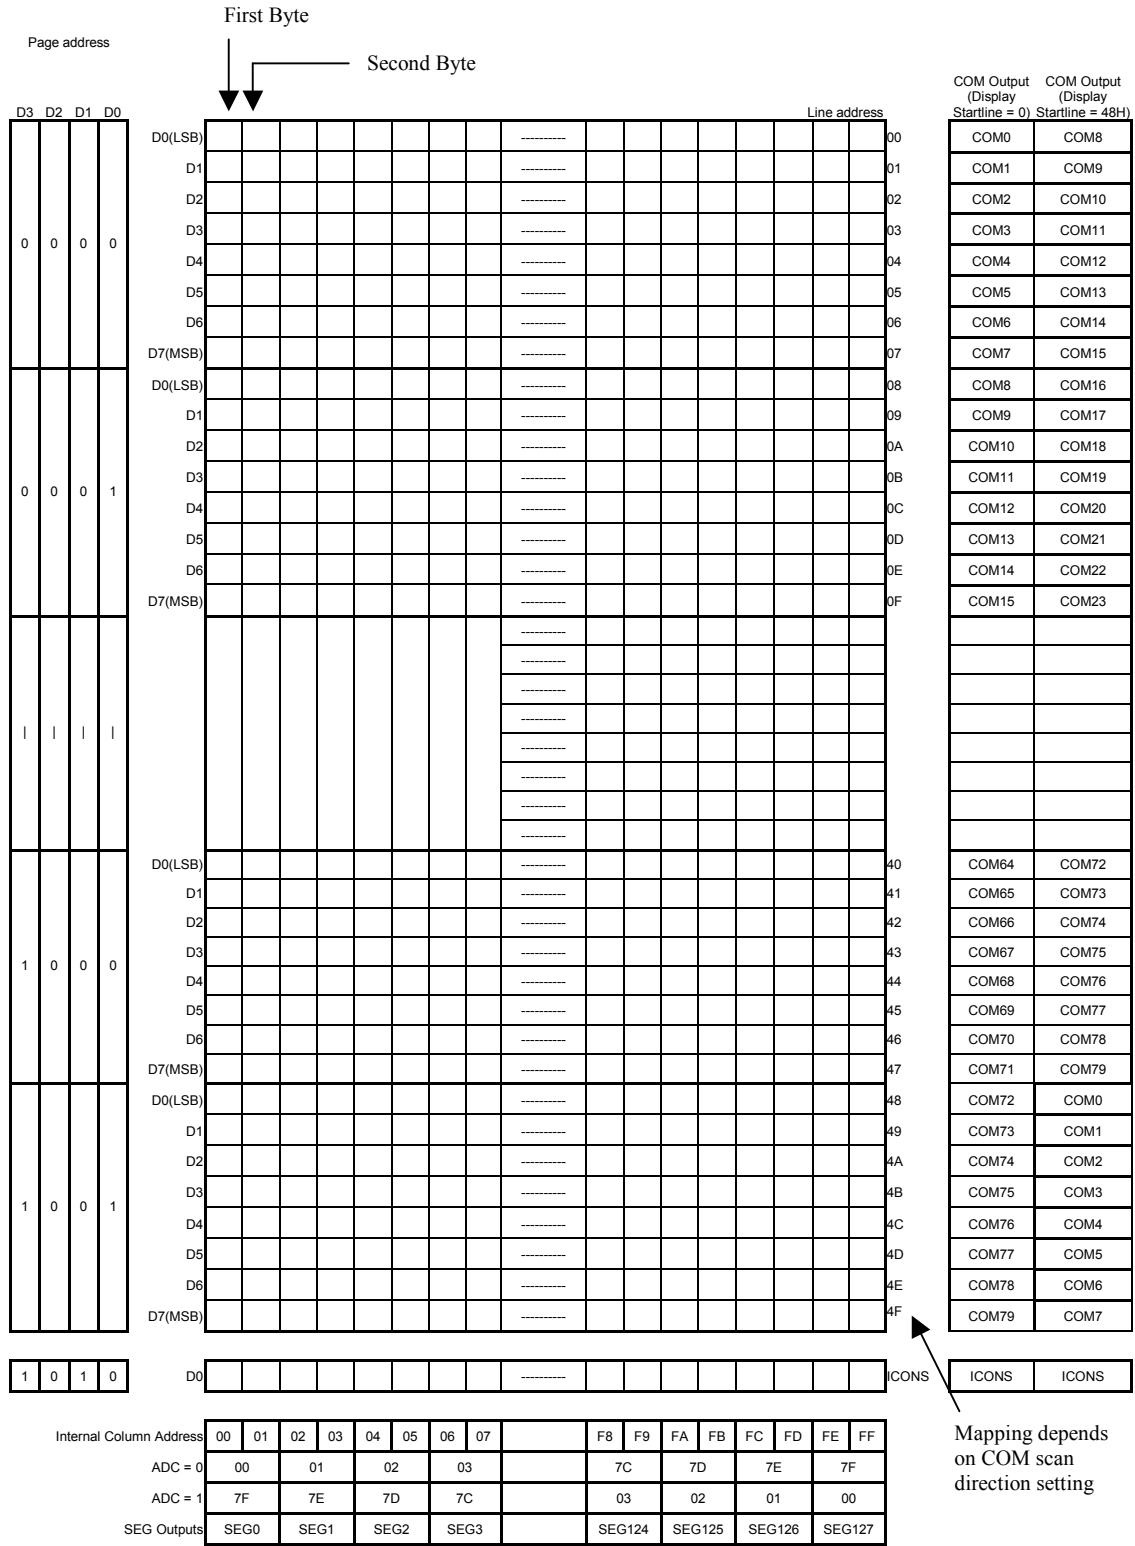

It should be noted that if there is a signal glitch at SCK that causing an out of synchronization in the serial communication, a hardware reset pulse at RES pin is required to initialize the chip for re-synchronization.

## Modes of operation

	6800 parallel	8080 parallel	Serial
Data Read	Yes	Yes	No
Data Write	Yes	Yes	Yes
Command Read	Status only	Status only	No
Command Write	Yes	Yes	Yes

## Graphic Display Data RAM (GDDRAM)

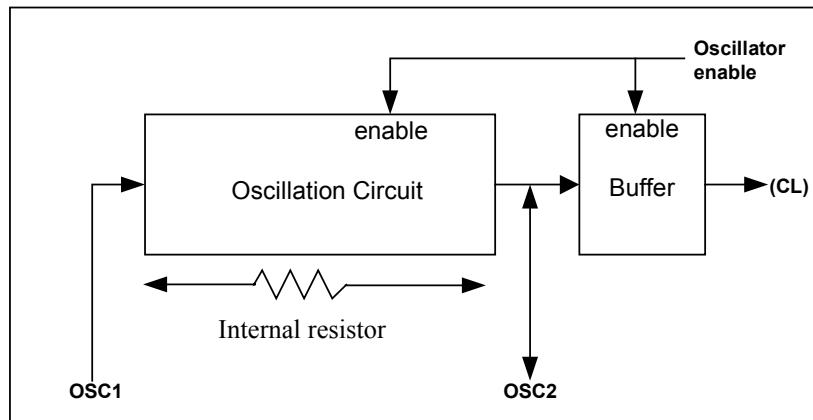

The GDDRAM is a bit mapped static RAM holding the bit pattern to be displayed. The size of the RAM is 128 x 81 x 2 = 20736bits. Figure 4 is a description of the GDDRAM address map. For mechanical flexibility, remapping on both Segment and Common outputs are provided respectively. For vertical scrolling of the display, an internal register storing the display start line can be set to control the portion of the RAM data to be mapped to the display. Figure 4 shows the cases in which the display start line register are set at 48H.

**Figure 4 - Graphic Display Data RAM (GDDRAM) Address Map for SSD1859 (with vertical scroll value 48H)**

## Oscillator Circuit

This module is an On-Chip low power RC oscillator circuitry (Figure 5). The oscillator generates the clock for the DC-DC voltage converter. This clock is also used in the Display Timing Generator.

**Figure 5 - Oscillator Circuitry**

## LCD Driving Voltage Generator and Regulator

This module generates the LCD voltage needed for display output. It takes a single supply input and generates necessary bias voltages. It consists of:

It consists of:

1. 3X, 4X, 5X and 6X DC-DC voltage converter
2. Bias Divider  
If the output op-amp buffer option in Set Power Control Register command is enabled, this circuit block will divide the regulator output ( $V_{out}$ ) to give the LCD driving levels ( $V_{L2} - V_{L5}$ ).  
The divider does not require external capacitors to reduce the external hardware and pin counts.
3. Contrast Control  
Software control of 64 voltage levels of LCD voltage.
4. Bias Ratio Selection circuitry  
Software control of 1/4 to 1/10 bias ratio to match the characteristic of LCD panel.
5. Self adjust temperature compensation circuitry  
Provide 2 different compensation grade selections to satisfy the various liquid crystal temperature grades. The grading can be selected by software control. Defaulted temperature coefficient (TC) value is  $-0.05\%/\text{ }^{\circ}\text{C}$ .

## 209 Bit Latch

A register carries the display signal information. In 128X81 display mode, data will be fed to the HV-buffer Cell and level-shifted to the required level.

## Level Selector

Level Selector is a control of the display synchronization.

Display voltage can be separated into two sets and used with different cycles. Synchronization is important since it selects the required LCD voltage level to the HV Buffer Cell, which in turn outputs the COM or SEG LCD waveform.

## HV Buffer Cell (Level Shifter)

HV Buffer Cell works as a level shifter, which translates the low voltage output signal to the required driving voltage. The output is shifted out with an internal FRM clock, which comes from the Display Timing Generator. The voltage levels are given by the level selector, which is synchronized with the internal M signal.

## Reset Circuit

When RES input is low, the chip is initialized to the following:

1. Page address is set to 0
2. Column address is set to 0
3. Display is OFF
4. Display Start Line is set to 0 (GDDRAM page 0, D0)
5. Display Offset is set to 0 (COM0 is mapped to ROW0)
6. 128x80 display mode
7. Normal/Reverse Display is Normal
8. N-line Inversion Register is 0
9. Entire Display is OFF
10. Power Control Register (VC, VR, VF) is set to (0,0,0)
11. 3X Booster is selected
12. Internal Resistor Ratio register is set to 0H
13. Software Contrast is set to 32
14. LCD Bias Ratio is set to 1/10
15. Normal scan direction of COM outputs
16. Segment remap is disabled (SEG0 display column address 0)
17. Internal oscillator is OFF
18. Test mode is OFF
19. Temperature coefficient is set to PTC0 (-0.05%)
20. Icon display line is OFF

When RESET command is issued, the following parameters are initialized only:

1. Page address is set to 0
2. Column address is set to 0
3. Initial Display Line is set to 0 (point to display RAM page 0, D0)
4. Internal Resistor Ratio register is set to 0H
5. Software Contrast is set to 32

## LCD Panel Driving Waveform

[www.DataSheet4U.com](http://www.DataSheet4U.com)

The following is an example of how the Common and Segment drivers may be connected to a LCD panel. The waveforms shown in Figure 6 and 7 illustrate the desired multiplex scheme with N-line Inversion feature is disabled (default).

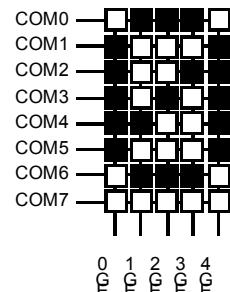

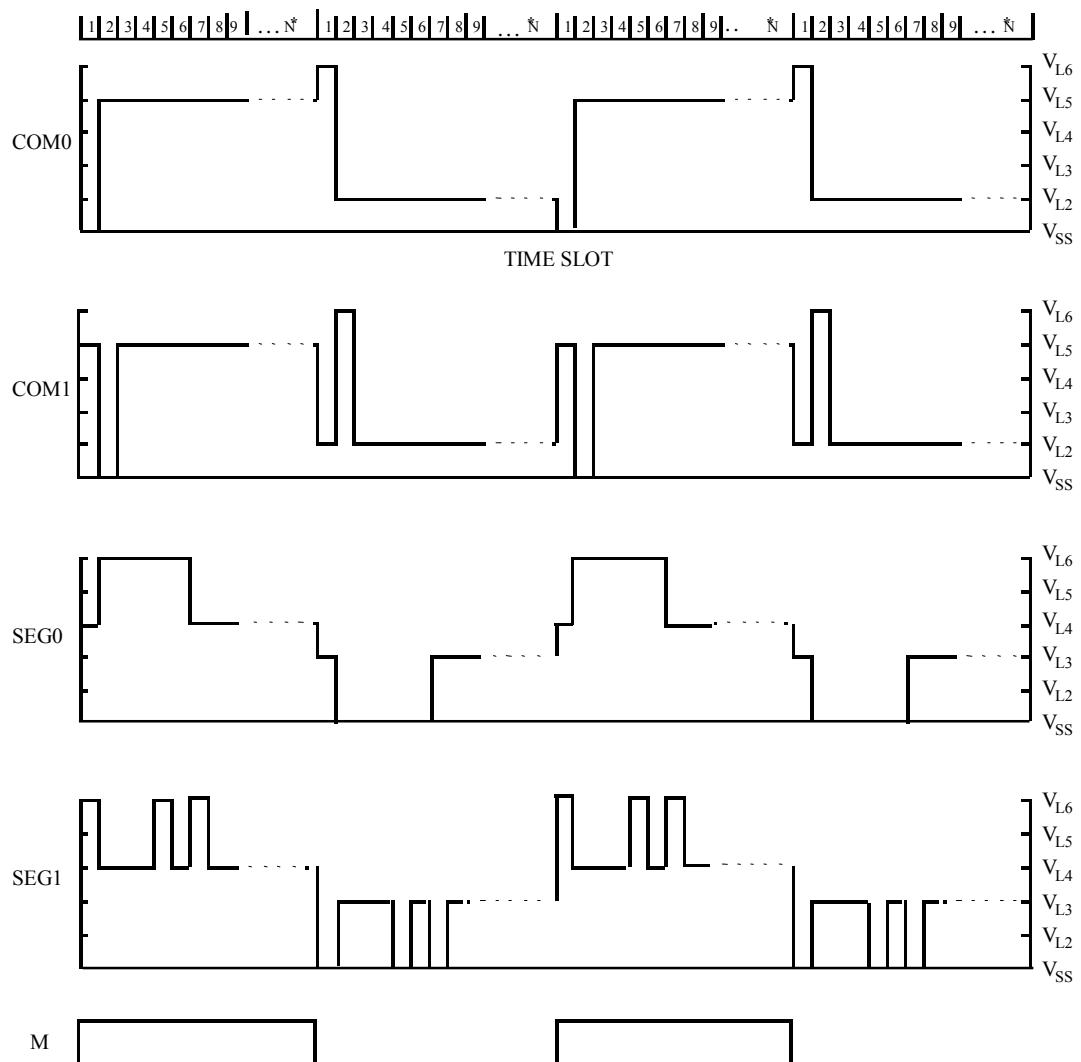

Figure 6 - LCD Display Example “0”

\* Note: N is the number of multiplex ratio including Icon line. If it is enabled, N is equal to 80 on POR

Figure 7 - LCD Driving Signal From SSD1859

## 8. COMMAND TABLE

**Table 3 - Command Table**

Hex	D7	D6	D5	D4	D3	D2	D1	D0	Command	Description
00~0F	0	0	0	0	C3	C2	C1	C0	Set Lower Column Address	Set the lower nibble of the column address pointer for RAM access. The pointer is reset to 0 after rest.
10~17	0	0	0	1	0	C6	C5	C4	Set Upper Column Address	Set the upper nibble of the column address pointer for RAM access. The pointer is reset to 0 after rest.
18~1F									Reserved	Reserved
20~27	0	0	1	0	0	R2	R1	R0	Set Internal Regulator Resistor Ratio	The internal regulator gain $(1+R2/R1)V_{out}$ increases as R2R1R0 is increased from 000b to 111b. The factor, $1+R2/R1$ , is given by: $R2R1R0 = 000: 2.84$ (POR) $R2R1R0 = 001: 3.71$ $R2R1R0 = 010: 4.57$ $R2R1R0 = 011: 5.44$ $R2R1R0 = 100: 6.30$ $R2R1R0 = 101: 7.16$ $R2R1R0 = 110: 8.03$ $R2R1R0 = 111: 8.89$
28~2F	0	0	1	0	1	VC	VR	VF	Set Power Control Register	VC=0: turns OFF the internal voltage booster (POR) VC=1: turns ON the internal voltage booster VR=0: turns OFF the internal regulator (POR) VR=1: turns ON the internal regulator VF=0: turns OFF the output op-amp buffer (POR) VF=1: turns ON the output op-amp buffer
30~3F									Reserved	Reserved
40~43	0 X	1 L6	0 L5	0 L4	0 L3	0 L2	X L1	X L0	Set Display Start Line	The second command specifies the row address pointer (0-79) of the RAM data to be displayed in COM0. This command has no effect on ICONS. The pointer is set to 0 after reset.
44~47	0 X	1 C6	0 C5	0 C4	0 C3	1 C2	X C1	X C0	Set Display Offset	The second command specifies the mapping of first display line (COM0) to one of ROW0~79. This command has no effect on ICONS. COM0 is mapped to ROW0 after reset.
48~4B	0 X	1 D6	0 D5	0 D4	1 D3	0 D2	X D1	X D0	Set Multiplex Ratio	The second command specifies the number of lines, excluding ICONS, to be displayed. With Icon is disabled (POR), duties 1/16~1/80 could be selected. With Icon enabled, the available duty ratios are 1/17~1/81.

Hex	D7	D6	D5	D4	D3	D2	D1	D0	Command	Description	www.DataSheet4U.com
4C~4F	0 X	1 X	0 X	0 N4	1 N3	1 N2	X N1	X N0	Set N-line Inversion	The second command sets the n-line inversion register from 3 to 33 lines to reduce display crosstalk. Register values from 00001b to 11111b are mapped to 3 lines to 33 lines respectively. Value 00000b disables the N-line inversion, which is the POR value. To avoid a fix polarity at some lines, it should be noted that the total number of mux (including the icon line) should NOT be a multiple of the lines of inversion (n).	
50~56	0	1	0	1	0	B2	B1	B0	Set LCD Bias	Sets the LCD bias from 1/4 ~ 1/10 according to B2B1B0: 000: 1/4 bias 001: 1/5 bias 010: 1/6 bias 011: 1/7bias 100: 1/8 bias 101: 1/9 bias 110: 1/10 bias (POR)

Bit Pattern	Command	Description	www.DataSheet4U.com
		<b>Lower bits Adjustment</b> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 0000: No adjustment (POR) X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 0001: + 1 step X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 0010: + 2 steps X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 0011: + 3 steps X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 0100: + 4 steps X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 0101: + 5 steps X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 0110: + 6 steps X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 0111: + 7 steps X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 1000: - 7 steps X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 1001: - 7 steps X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 1010: - 6 steps X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 1011: - 5 steps X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 1100: - 4 steps X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 1101: - 3 steps X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 1110: - 2 steps X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 1111: - 1 step  The result for upper 4 bits & lower 4 bits are additive.	
Other than the above	Set Test Mode	Reserved	

### Frame Frequency Default Setting

Frame Frequency = Fosc / [Mux x (FRAMEFQ + 1) x PWM]

Mux (Icon Enable)	FRAMEFQ	PWM	Fosc (kHz)
Mux<=17	2	15	58
	5	12	92
	4	9	58
18<=MUX<=33	1	15	77
	1	12	58
	2	9	77
34<=MUX<=49	0	15	58
	1	12	92
	1	9	77
50<=MUX<=65	0	15	77
	0	12	58
	1	9	92
66<=MUX<=81	0	15	92
	0	12	77
	0	9	58

PWM is defined in command Set PWM and FRC.

## Read Status Byte

A 8 bits status byte will be placed onto the data bus when a read operation is performed if D/C is low. The status byte is defined as following:

D7	D6	D5	D4	D3	D2	D1	D0	Comment
BUSY	ON	<u>RES</u>	0	1	0	0	1	BUSY=0 : Chip is idle BUSY=1 : Chip is executing instruction ON=0 : Display is OFF ON=1 : Display is ON <u>RES</u> =0: Chip is idle <u>RES</u> =1: Chip is executing reset

## Data Read / Write

To read data from the GDDRAM, input High to R/W(WR) pin and D/C pin for 6800-series parallel mode, Low to E(RD) pin and High to D/C pin for 8080-series parallel mode. No data read is provided for serial mode. In normal mode, GDDRAM column address pointer will be increased by one automatically after each data read. Also, a dummy read is required before the first data is read. See Figure 3 in Functional Description.

To write data to the GDDRAM, input Low to R/W(WR) pin and High to D/C pin for 6800-series parallel mode. For serial interface, it will always be in write mode. GDDRAM column address pointer will be increased by one automatically after each data write. After the data read/write operation (address=127) is executed, the address will be reset to 0 in next data read/write operation.

## Address Increment Table (Automatic)

D/C	R/W( <u>WR</u> )	Action	Auto Address Increment
0	0	Write Command	No
0	1	Read Status	No
1	0	Write Data	Yes
1	1	Read Data	Yes

Address Increment is done automatically after data read/write. The column address pointer of GDDRAM is affected. After the data read/write operation (address=127) is executed, the address will be reset to 0 in next data read/write operation.

## Commands Required for R/W (WR) Actions on RAM

R/W ( <u>WR</u> ) Actions on RAMs	Commands Required	
Read/Write Data from/to GDDRAM.	Set GDDRAM Page Address Set GDDRAM Column Address Read/Write Data	(1011X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> )* (0001X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> )* (0000X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> )* (X <sub>7</sub> X <sub>6</sub> X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> )

\* No need to resend the command again if it is set previously.

The read / write action to the Display Data RAM does not depend on the display mode. This means the user can change the RAM content whether the target RAM content is being displayed or not.

## 10. COMMAND DESCRIPTIONS

www.DataSheet4U.com

### **Set Display On/Off**

This command turns the display on/off, by the value of the LSB.

### **Set Display Start Line**

This command is to set Display Start Line register to determine starting address of display RAM to be displayed by selecting a value from 0 to 79. With value equals to 0, D0 of Page 0 is mapped to COM0. With value equals to 1, D1 of Page0 is mapped to COM0. The display start line values of 0 to 9 are assigned to Page 0 to 9.

### **Set Page Address**

This command positions the page address to 0 to 8/10 possible positions in GDDRAM. Refer to Figure 4. Set Higher Column Address This command specifies the higher nibble of the 7-bit column address of the display data RAM. The column address will be incremented by each data access after it is pre-set by the MCU and returning to 0 once overflow (>127).

### **Set Lower Column Address**

This command specifies the lower nibble of the 7-bit column address of the display data RAM. The column address will be incremented by each data access after it is pre-set by the MCU and returning to 0 once overflow (>127).

### **Set Segment Re-map**

This commands changes the mapping between the display data column address and segment driver. It allows flexibility in layout during LCD module assembly. Refer to Figure 4.

### **Set Normal/Inverse Display**

This command sets the display to be either normal/inverse. In normal display, a RAM data of 1 indicates an "ON" pixel. While in reverse display, a RAM data of 0 indicates an "ON" pixel. The icon line is not affected by this command.

### **Set Entire Display On/Off**

This command forces the entire display, including the icon row, to be "ON" regardless of the contents of the display data RAM. This command has priority over normal/inverse display.

To execute this command, Set Display On command must be sent in advance.

### **Set LCD Bias**

This command is used to select a suitable bias ratio (1/4 to 1/11) required for driving the particular LCD panel in use. The POR default is set to 1/10 bias.

### **Software Reset**

This command causes some of the internal status of the chip to be initialized:

1. Page address is set to 0
2. Column address is set to 0
3. Initial Display Line is set to 0 (point to display RAM page 0, D0)
4. Internal Resistor Ratio register is set to (0,0,0)
5. Software Contrast is set to 32

### **Set COM Output Scan Direction**

This command sets the scan direction of the COM output allowing layout flexibility in LCD module assembly.

### **Set Power Control Register**

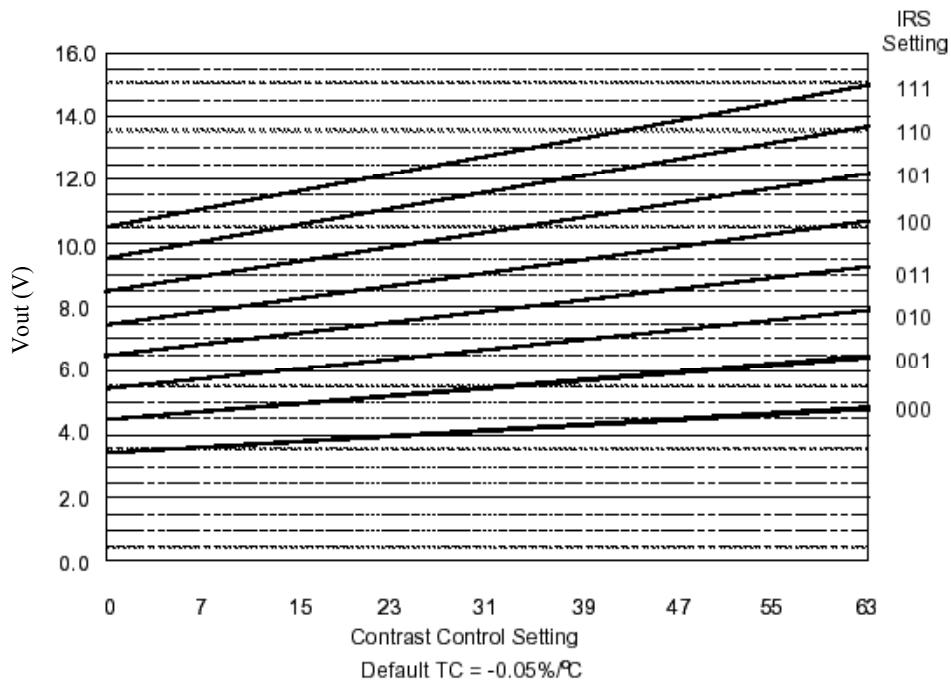

This command turns on/off the various power circuits associated with the chip.

### Set Internal Regulator Resistors Ratio

This command is to enable any one of the eight internal resistor (IRS) settings for different regulator gains when using internal regulator resistor network (INTRS pin pulled high). The Contrast Control Voltage Range curves below is referred to the following formula:

$$V_{out} = \left(1 + \frac{R_2}{R_1}\right) * V_{con}$$

$$V_{con} = \left(1 - \frac{63 - \alpha}{210}\right) * V_{ref} \quad , \text{where } V_{ref} = 1.7V$$

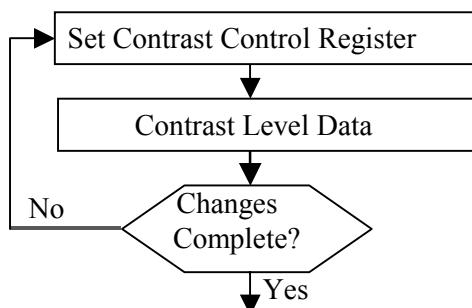

**Figure 8 - Contrast Control Voltage Range Curve**

## **Set Contrast Control Register**

[www.DataSheet4U.com](http://www.DataSheet4U.com)

This command adjusts the contrast of the LCD panel by changing VOUT of the LCD drive voltage provided by the On-Chip power circuits. VOUT is set with 64 steps (6-bit) contrast control register. It is a compound commands:

**Figure 9 - Contrast Control Flow**

## **Set Display Offset**

The next command specifies the mapping of display start line (COM0 if display start line register equals to 0) to one of ROW0-79. This command has no effect on ICONS. COM0 is mapped to ROW0 after reset.

## **Set Multiplex Ratio**

This command switches default 80 multiplex mode to any multiplex from 16 to 80, if Icon is disabled (POR). When Icon is set enable, the corresponding multiplex ratio setting will be mapped to 17 to 81. The chip pads ROW0-ROW79 will be switched to corresponding COM signal output.

## **Set Power Save Mode**

This command forces the chip to enter Standby or Sleep Mode. LSB of the command will define which mode will be entered.

## **Exit Power Save Mode**

This command releases the chip from either Standby or Sleep Mode and return to normal operation.

## **Set N-line Inversion**

Number of line inversion is set by this command for reducing crosstalk. 3 to 33-line inversion operations could be selected. At POR, this operation is disabled.

It should be noted that the total number of mux (including the icon line) should NOT be a multiple of the inversion number (N). Or else, some lines will not be changed their polarity during frame change.

## **Exit N-line Inversion**

This command releases the chip from N-line inversion mode. The driving waveform will be inverted once per frame after issuing this command.

## **Set DC-DC Converter Factor**

Internal DC-DC converter factor is set by this command. 3X to 6X multiplying factors could be selected using this command. Hardware configuration is used for 6X setup.

## **Set Icon Enable**

This command enable/disable the Icon display.

## **Start Internal Oscillator**

After POR, the internal oscillator is OFF. It should be turned ON by sending this command to the chip.

**Set Display Data Length**

This two-byte command only valid when 3-wire SPI configuration is set by H/W input (PS0=PS1=L). The second 8-bit is used to indicate that a specified number display data byte (1-256) are to be transmitted. Next byte after the display data string is handled as a command.

**Set Gray Scale Mode (White/Light Gray/Dark Gray/Black)**

Command 88(hex) to 8F(hex) are used to specify the four gray levels' pulse width at the four possible frames. The four gray levels are called white, light gray, dark gray and black. Each level is defined by 4 registers for 4 consecutive frames. For example, WA is a 4-bit register to define the pulse width of the 1<sup>st</sup> frame in White mode. WB is a register for 2<sup>nd</sup> frame in White mode etc. Each command specifies two registers.

**For 4 FRC,**

Memory Content		Gray Mode	FRAME			
1 <sup>st</sup> Byte	2 <sup>nd</sup> Byte		1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup>
0	0	White	WA	WB	WC	WD
0	1	Light Gray	LA	LB	LC	LD
1	0	Dark Gray	DA	DB	DC	DD
1	1	Black	BA	BB	BC	BD

**For 3 FRC,**

Memory Content		Gray Mode	FRAME			
1 <sup>st</sup> Byte	2 <sup>nd</sup> Byte		1 <sup>st</sup>	2 <sup>nd</sup>	3 <sup>rd</sup>	4 <sup>th</sup> (No use)
0	0	White	WA	WB	WC	WD (XX)
0	1	Light Gray	LA	LB	LC	LD (XX)
1	0	Dark Gray	DA	DB	DC	DC (XX)
1	1	Black	BA	BB	BC	BC (XX)

**Set PWM and FRC**

This command selects the number of frames in frame rate control, or the number of levels in the pulse width modulation.

**Set Test Mode**

This command forces the driver chip into its test mode for internal testing of the chip. Under normal operation, user should NOT use this command.

**Status Register Read**

This command is issued by setting D/C Low during a data read (refer to Figure 10 to 13 of parallel interface waveform, P.32-35). It allows the MCU to monitor the internal status of the chip. No status read is provided for serial mode.

**EXTENDED COMMANDS**

These commands are used, in addition to basic commands, to trigger the enhanced features designed for the chip. These features are on top of general ones.

**Set Temperature Coefficient (TC) Value**

This command is to set 1 out of 2 different temperature coefficients in order to match various liquid crystal temperature grades.

**Select Oscillator Source**

This command enables the external clock input from CL pin.

### Oscillator adjustment

This command is used to adjust the oscillator frequency to desired frame frequency.

### Lock/Unlock Interface

After sending the lock command, the interface will be disabled until the unlock command is received. The lock command is suggested whenever the LCD driver will not be accessed for some period. This can minimize incorrect data or command written due to noisy interface.

### Low Power mode

The current consumption will be reduced when enter the Low Power Mode. However, crosstalk compensation may be required after entered the low power mode.

### Crosstalk Compensation

By using these double commands, 0xFC; 0xNN, to adjust the upper 4 bits and/or lower 4 bits, it can compensate the crosstalk.

## 11. MAXIMUM RATINGS

[www.DataSheet4U.com](http://www.DataSheet4U.com)

**Table 5 - Maximum Ratings** (Voltage Referenced to V<sub>SS</sub>)

Symbol	Parameter	Value	Unit
V <sub>DD</sub>	Supply voltage	-0.3 to 4.0	V
V <sub>OUT</sub>		V <sub>SS</sub> -0.3 to V <sub>SS</sub> +18.0	V
V <sub>CI</sub>	Booster Supply Voltage	V <sub>DD</sub> to 4.0	V
V <sub>in</sub>	Input Voltage	V <sub>SS</sub> -0.3 to V <sub>DD</sub> +0.3	V
I	Current Drain Per Pin Excluding V <sub>DD</sub> and V <sub>SS</sub>	25	mA
T <sub>A</sub>	Operating Temperature	-40 to +85	°C
T <sub>stg</sub>	Storage Temperature Range	-65 to +150	°C

\* Maximum Ratings are those values beyond which damage to the device may occur. Functional operation should be restricted to the limits in the Electrical Characteristics tables or Pin Description section.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions to be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit. For proper operation it is recommended that Vin and Vout be constrained to the range V<sub>SS</sub> < or = (Vin or V<sub>OUT</sub>) < or = V<sub>DD</sub>. Reliability of operation is enhanced if unused inputs are connected to an appropriate logic voltage level (e.g., either V<sub>SS</sub> or V<sub>DD</sub>). Unused outputs must be left open. This device may be light sensitive. Caution should be taken to avoid exposure of this device to any light source during normal operation. This device is not radiation protected.

## 12. ELECTRICAL CHARACTERISTICS

[www.DataSheet4U.com](http://www.DataSheet4U.com)

**Table 6 - DC Characteristics** (Voltages Referenced to V<sub>SS</sub>, V<sub>DD</sub>=1.8 to 3.3V, T<sub>A</sub>=-40 to 85°C; unless otherwise specified.)

Symbol	Parameter	Test Condition	Min	Typ (at 25°C)	Max	Unit

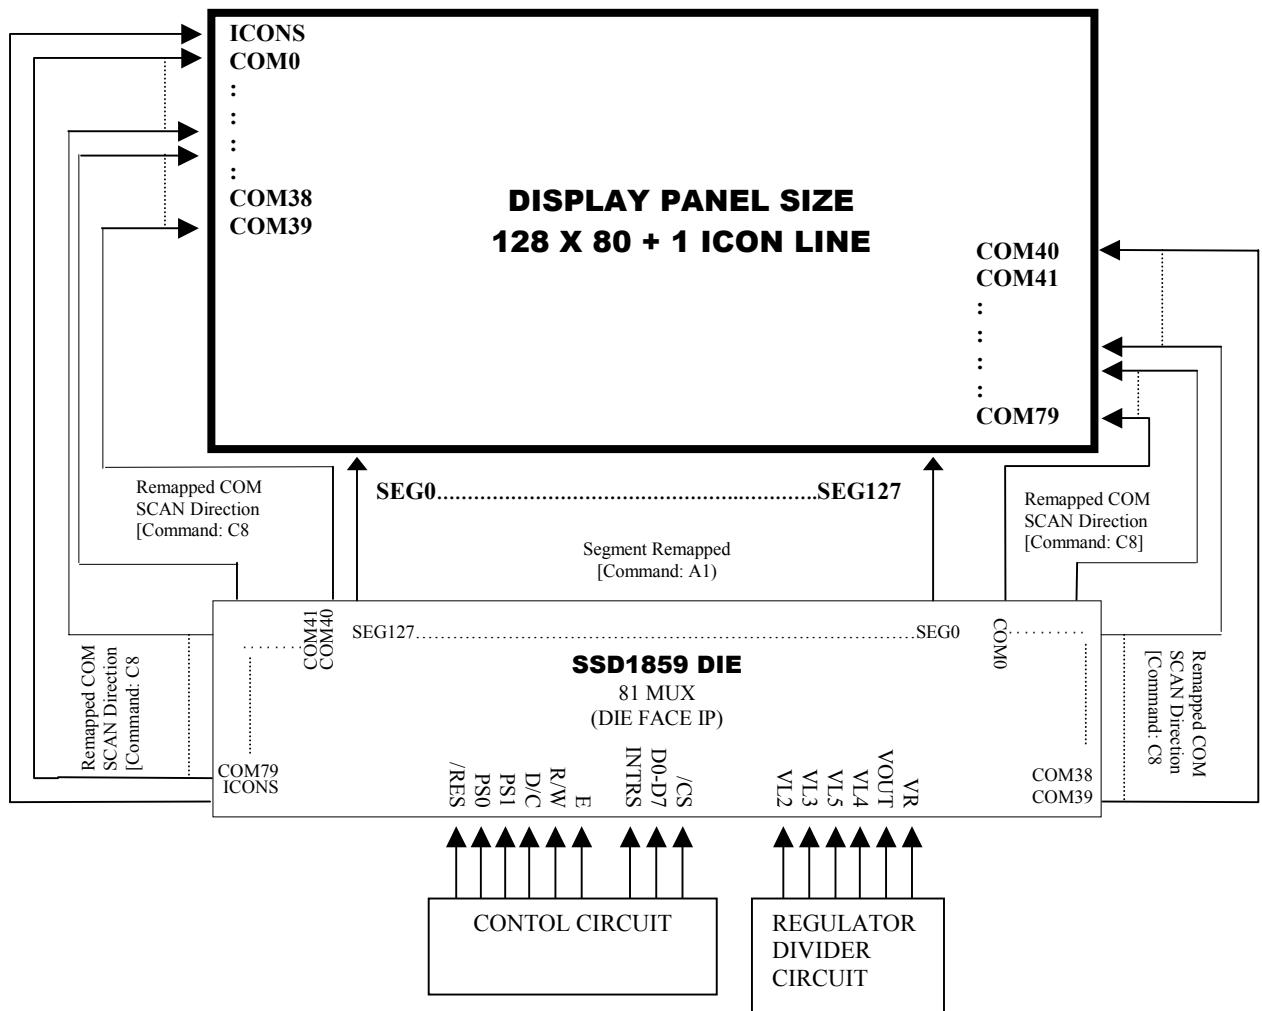

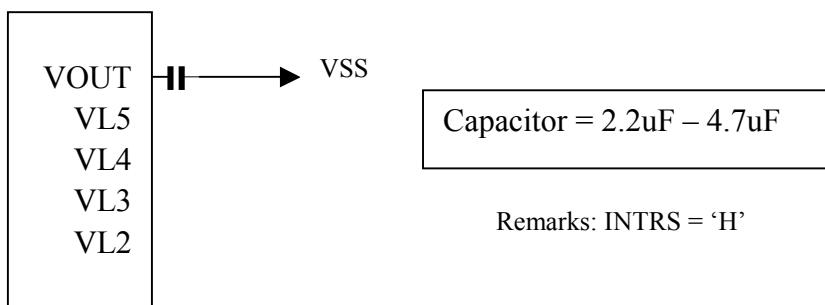

Figure 16 - Application Circuit

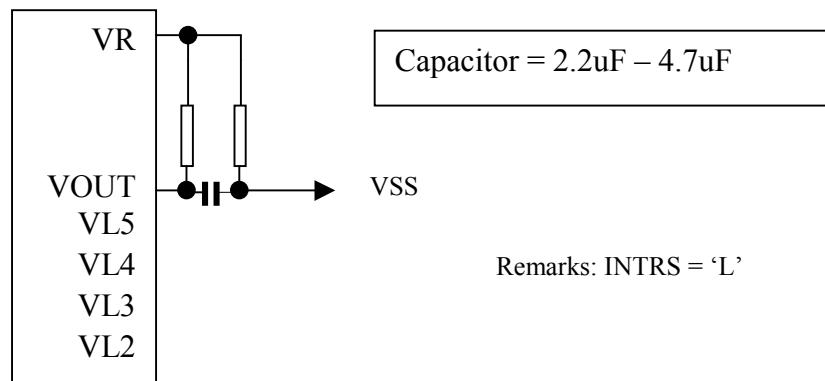

## Application Circuit: Regulator Circuit and Bias Divider Circuit

[www.DataSheet4U.com](http://www.DataSheet4U.com)

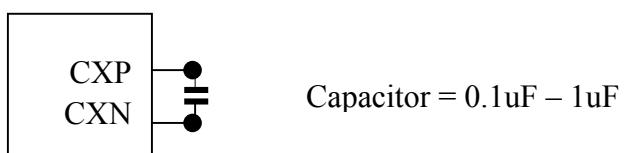

### Internal Regulator and Bias Divider [COMMAND: 2F]

### External Regulator and Internal Bias Divider [COMMAND: 2D]

### 6X DC-DC Converter Factor [COMMAND: 67]

## OTP Programming Circuit and Sequence

OTP (One Time Programming) is a method to adjust the VOUT. In order to eliminate the variations of LCD module in term of contrast level, OTP can be used to achieve the best contrast of every LCD modules.

OTP setting and programming should include two major steps of (1) Find the OTP offset and (2) OTP programming as following,

### Step 1. Find the OTP offset

- (1) Hardware Reset (sending an active low reset pulse to RES pin)
- (2) Send original initialization routines
- (3) Set and display any test patterns
- (4) Adjust the contrast value (0x81, 0x00~0x3F) until there is the best visual contrast
- (5) OTP setting steps = Contrast value of the best visual contrast - Contrast value of original initialization

#### Example 1:

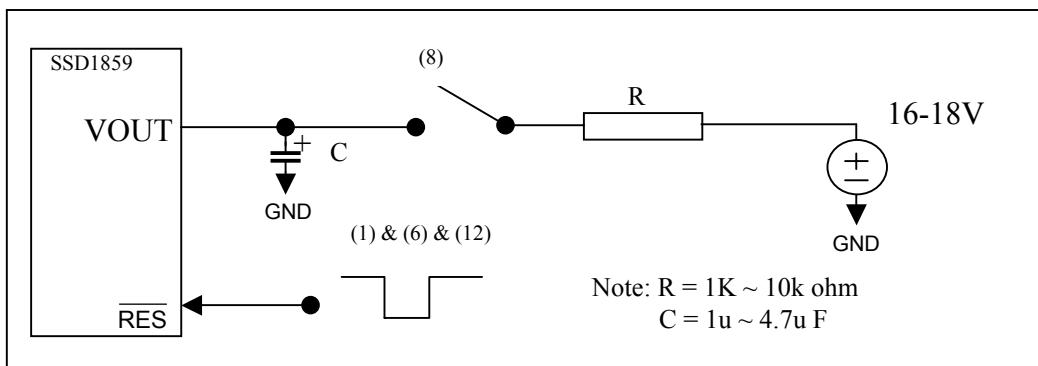

Contrast value of original initialization = 0x20  
 Contrast value of the best visual contrast = 0x24  
 OTP setting steps = 0x24 - 0x20 = +4  
 OTP setting commands should be (0x82, 0xF4)

#### Example 2:

Contrast value of original initialization = 0x20  
 Contrast value of the best visual contrast = 0x1B  
 OTP setting steps = 0x1B - 0x20 = -5  
 OTP setting commands should be (0x82, 0xFB)

### Step 2. OTP programming

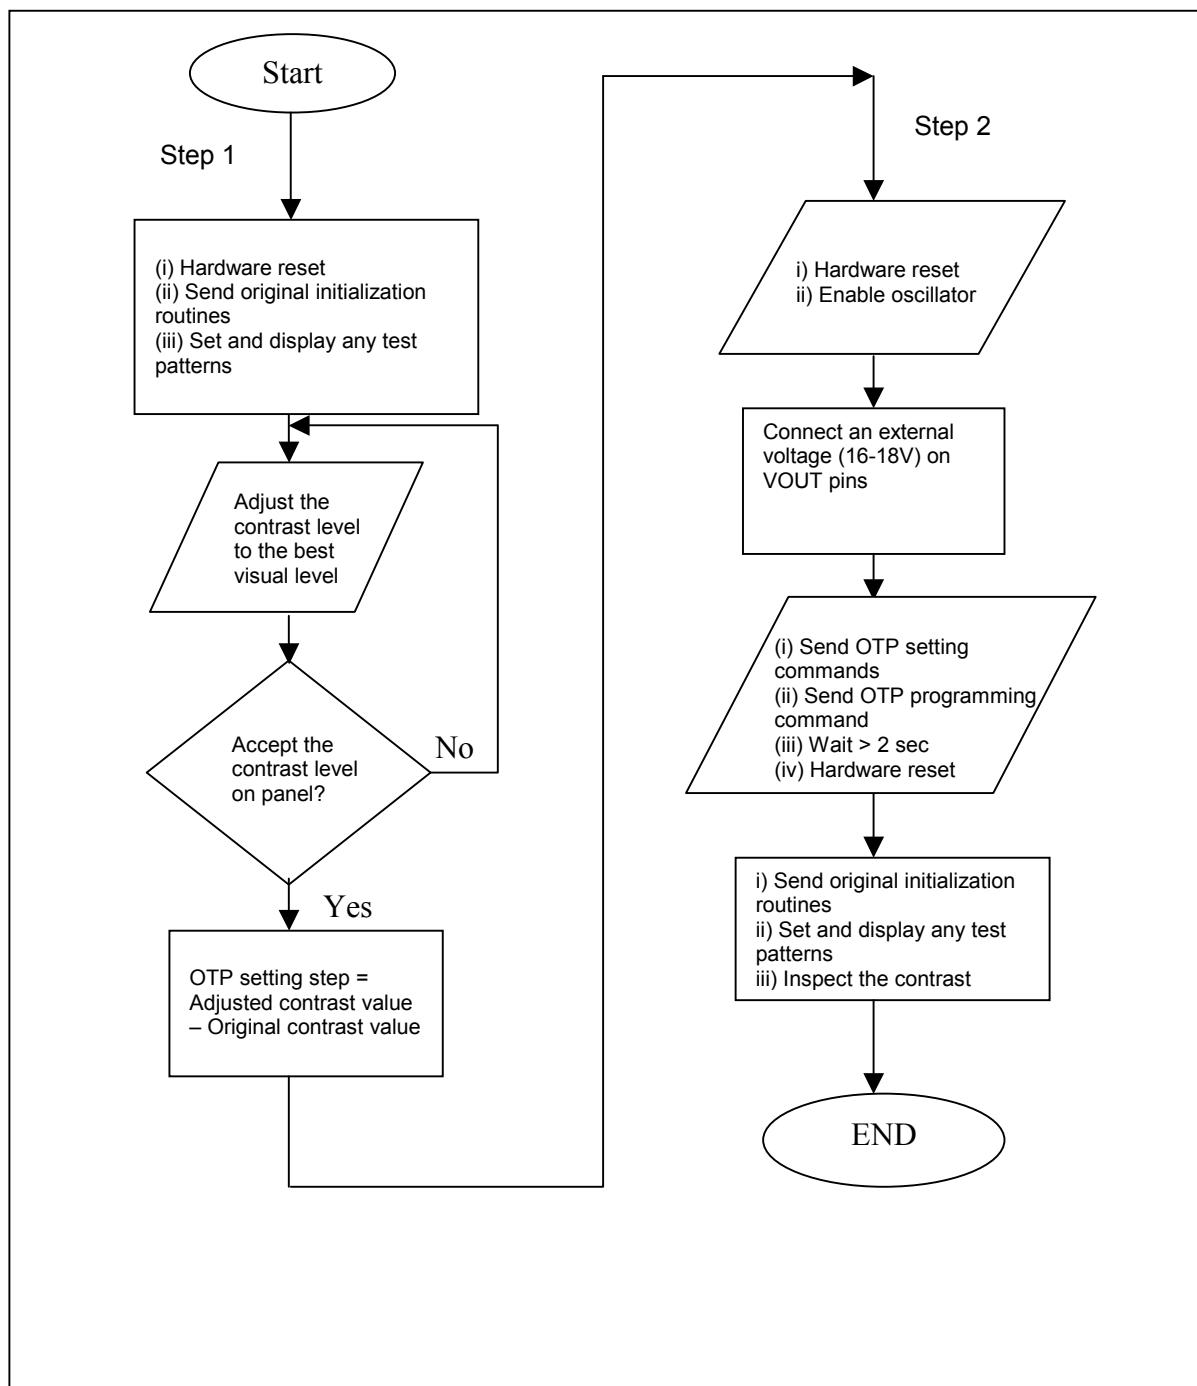

- (6) Hardware Reset (sending an active low reset pulse to RES pin)
  - (7) Enable Oscillator (0xAB)
  - (8) Connect an external VOUT (see diagram below)
  - (9) Send OTP setting commands that we find in step 1 (0x82, 0xF0~0xFF)
  - (10) Send OTP programming command (0x83)
  - (11) Wait at least 2 seconds
  - (12) Hardware Reset
- Verify the result by repeating step 1. (2) – (3)

OTP Programming Circuit

## Flow Chart of OTP Program

www.DataSheet4U.com

## OTP Example program

### Find the OTP offset:

1. Hardware reset by sending an active low reset pulse to  $\overline{\text{RES}}$  pin
2. COMMAND(0XAB)      \Enable oscillator  
COMMAND(0X2F)      \ turn on the internal voltage booster, internal regulator and output op-amp buffer; Select booster level
3. COMMAND(0X48)      \ Set Duty ratio  
COMMAND(0X40)      \ 64Mux  
COMMAND(0X55)      \ Set Biasing ratio (1/9 BIAS)
4. COMMAND(0X81)      \ Set target gain and contrast.  
COMMAND(0X2D)      \ contrast = 45  
COMMAND(0X24)      \ gain = 5.1
5. \ Set target display contents  
COMMAND(0XB0)      \ set page address  
COMMAND(0x00)      \ set lower nibble column address  
COMMAND(0X10)      \ set higher nibble column address  
DATA(...)      \ write target content to GDDRAM  
COMMAND(0XAF)      \ Set Display On
6. OTP offset calculation... target OTP offset value is +3

### OTP programming:

7. Hardware reset by sending an active low reset pulse to  $\overline{\text{RES}}$  pin
8. COMMAND(0XAB)      \ Enable Oscillator
9. Connect an external VOUT (16V-18V)
10. COMMAND(0X82)      \ Set OTP offset value to +3 (0011)  
COMMAND(0XF3)      \ 0001 X<sub>3</sub>X<sub>2</sub>X<sub>1</sub>X<sub>0</sub>, where X<sub>3</sub>X<sub>2</sub>X<sub>1</sub>X<sub>0</sub> is the OTP offset value
11. COMMAND(0X83)      \ Send the OTP programming command
12. Wait at least 2 seconds for programming wait time
13. Hardware reset by sending an active low reset pulse to  $\overline{\text{RES}}$  pin

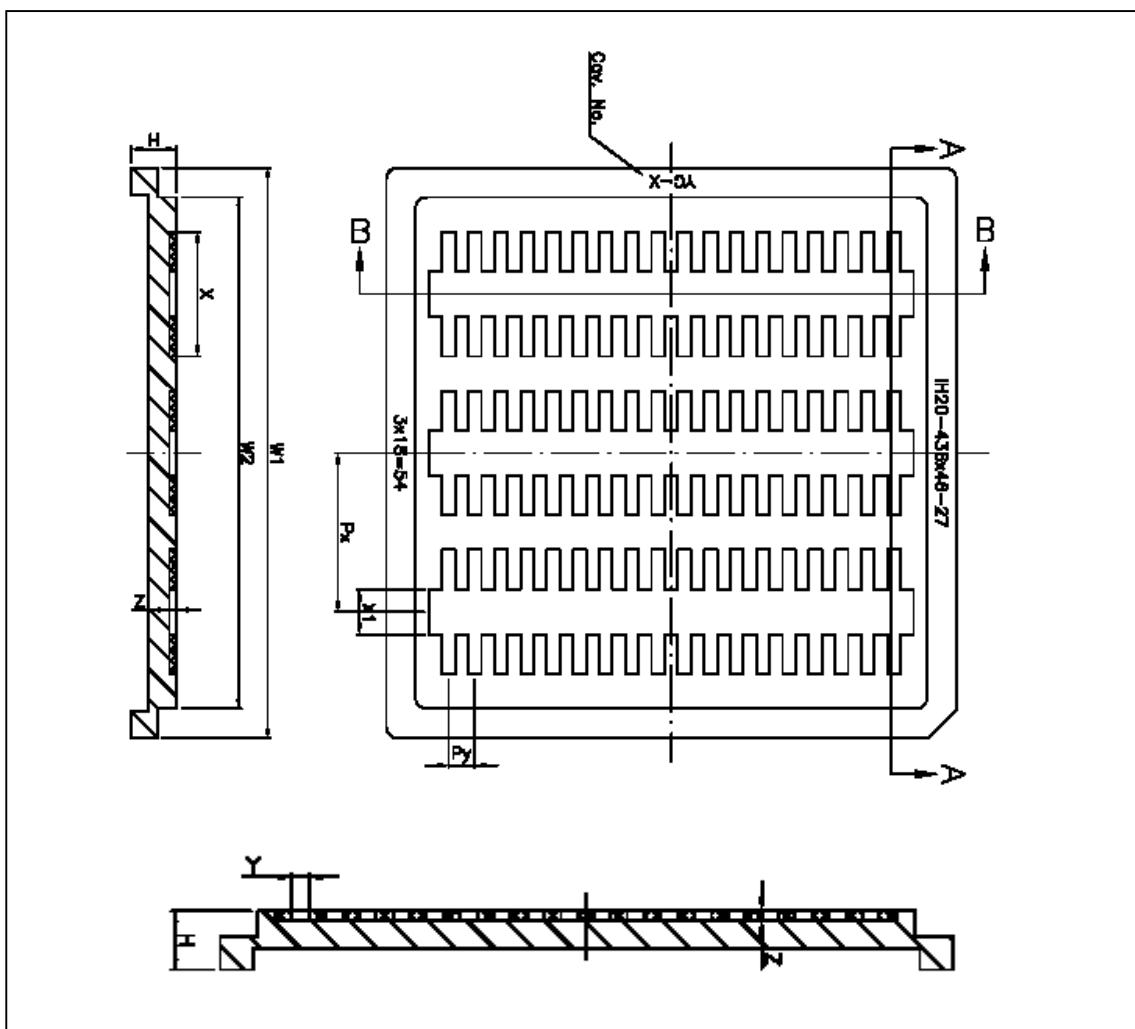

### Verify the result:

14. After OTP programming, procedure 2 to 5 are repeated for inspection of the contrast on the panel
