**Description**

The CY29943 is a low-voltage 200-MHz clock distribution buffer with an LVPECL-compatible input clock. All other control inputs are LVCMOS-/LVTTTL-compatible. The eighteen outputs are 2.5V or 3.3V LVCMOS- or LVTTTL-compatible and can drive 50Ω series or parallel terminated transmission lines. For series terminated transmission line, each output can drive one or two traces giving the device an effective fanout of 1:36. Low output-to-output skews make the CY29943 an ideal clock distribution buffer for nested clock trees in the most demanding of synchronous systems.

**Maximum Ratings<sup>[2]</sup>**

Maximum Input Voltage Relative to  $V_{SS}$ : .....  $V_{SS} - 0.3V$   
 Maximum Input Voltage Relative to  $V_{DD}$ : .....  $V_{DD} + 0.3V$   
 Storage Temperature: .....  $-65^{\circ}C$  to  $+150^{\circ}C$   
 Operating Temperature: .....  $-40^{\circ}C$  to  $+85^{\circ}C$   
 Maximum ESD protection ..... 2 kV  
 Maximum Power Supply: ..... 5.5V  
 Maximum Input Current: .....  $\pm 20$  mA

This device contains circuitry to protect the inputs against damage due to high static voltages or electric field; however, precautions should be taken to avoid application of any voltage higher than the maximum rated voltages to this circuit. For proper operation,  $V_{in}$  and  $V_{out}$  should be constrained to the range:

$$V_{SS} < (V_{in} \text{ or } V_{out}) < V_{DD}$$

Unused inputs must always be tied to an appropriate logic voltage level (either  $V_{SS}$  or  $V_{DD}$ ).

**DC Parameters** ( $V_{DD} = 3.3V \pm 5\%$  or  $2.5V \pm 5\%$ ,  $V_{DDC} = 3.3V \pm 5\%$  or  $2.5V \pm 5\%$ , over the specified temperature range)

**Notes:**

- Multiple Supplies:** The Voltage on any input or I/O pin cannot exceed the power pin during power-up. Power supply sequencing is NOT required.
- Inputs have pull-up/pull-down resistors that effect input current.
- The  $V_{CMR}$  is the difference from the most positive side of the differential input signal. Normal operation is obtained when the "High" input is within the  $V_{CMR}$  range and the input lies within the VPP specification.
- Driving series or parallel terminated 50 $\Omega$  (or 50 $\Omega$  to  $V_{DD}/2$ ) transmission lines.
