

## USB 2.0 Hi-Speed 2-Port Hub Controller

### PRODUCT FEATURES

Datasheet

#### General Description

The SMSC 2-Port Hub is a low power, OEM configurable, STT (Single transaction translator) hub controller IC with 2 downstream ports for embedded USB solutions. The 2-port hub is fully compliant with the USB 2.0 Specification and will attach to an upstream port as a Full-Speed Hub or as a Full-/Hi-Speed Hub. The 2-Port Hub supports Low-Speed, Full-Speed, and Hi-Speed (if operating as a Hi-Speed Hub) downstream devices on all of the enabled downstream ports.

#### General Features

- Hub Controller IC with 2 downstream ports
- Enhanced OEM configuration options available through either a single serial I<sup>2</sup>C EEPROM, or SMBus Slave Port
- 36-pin (6x6mm) QFN lead-free, RoHS compliant package

#### Hardware Features

- Low power operation
- Full Power Management with individual or ganged power control of each downstream port
- On-chip Power On Reset (POR)
- Internal 1.8V Voltage Regulator
- Fully integrated USB termination and Pull-up/Pull-down resistors
- On Board 24MHz Crystal Driver, Resonator or External 24MHz clock input
- Enhanced EMI rejection and ESD protection performance

#### OEM Selectable Features

- Customizable Vendor ID, Product ID, and Device ID
- Select whether the hub is part of a compound device (When any downstream port is permanently hardwired to a USB peripheral device, the hub is part of a compound device)
- Flexible port mapping and disable sequence. Ports can be disabled/reordered in any order to support multiple product SKUs. Hub will automatically reorder the remaining ports to match the Host controller's numbering scheme.
- Programmable USB differential-pair pin location. Ease PCB layout by aligning USB signal lines directly to connectors
- Programmable USB signal drive strength. Recover USB signal integrity due to compromised system environment using 2-level driving strength resolution

- Select the presence of a permanently hardwired USB peripheral device on a port by port basis
- Configure the delay time for filtering the over-current sense inputs
- Configure the delay time for turning on downstream port power
- Indicate the maximum current that the 2-port hub consumes from the USB upstream port
- Indicate the maximum current required for the hub controller
- Pin Selectable Options for Default Configuration
  - Select Downstream Ports as Non-Removable Ports

#### Applications

- LCD monitors and TVs
- Multi-function USB peripherals
- PC mother boards
- Set-top boxes, DVD players, DVR/PVR
- Printers and scanners
- PC media drive bay
- Portable hub boxes
- Mobile PC docking
- Embedded systems

## Chapter 3 Pin Descriptions

### 3.1 PIN Descriptions

This section provides a detailed description of each signal. The signals are arranged in functional groups according to their associated interface.

The “N” symbol in the signal name indicates that the active, or asserted, state occurs when the signal is at a low voltage level. When “N” is not present before the signal name, the signal is asserted when at the high voltage level.

The terms assertion and negation are used exclusively. This is done to avoid confusion when working with a mixture of “active low” and “active high” signals. The term assert, or assertion, indicates that a signal is active, independent of whether that level is represented by a high or low voltage. The term negate, or negation, indicates that a signal is inactive.

**Table 3.1 USB2512A Pin Descriptions**

SYMBOL	QFN-36 EMB	BUFFER TYPE	DESCRIPTION
<b>UPSTREAM USB INTERFACES</b>			
USBUP_DP USBUP_DM	31 30	IO-U	USB Bus Data  These pins connect to the upstream USB bus data signals such as the Host port or upstream Hub.
VBUS_DET	27	I/O12	Detect Upstream VBUS Power  Detects state of Upstream VBUS power. The SMSC Hub monitors VBUS_DET to determine when to assert the internal D+ pull-up resistor which signals a connect event.  When designing a detachable hub, this pin must be connected to the VBUS power pin of the USB port that is upstream of the Hub.  For self-powered applications with a permanently attached host, this pin must be connected to 3.3V (typically VDD33).
<b>DOWNSTREAM 2-PORT USB 2.0 INTERFACE</b>			
USBDN_DP[2:1]/ & USBDN_DM[2:1]	4 2 3 1	IO-U	Hi-Speed USB Data  These pins connect to the downstream USB peripheral devices attached to the Hub's port.
P RTPWR[2:1]	16 12	O12	USB Power Enable  Enables power to USB peripheral devices downstream.  Note: The Hub supports active high power controllers only!
OCS[2:1]_N	17 13	IPU	Over-Current Sense  Input from external current monitor indicating an over-current condition.  {Note: Contains internal pull-up to 3.3V supply}

Table 3.1 USB2512A Pin Descriptions (continued)

SYMBOL	QFN-36 EMB	BUFFER TYPE	DESCRIPTION
RBIAS	35	I-R	USB Transceiver Bias A 12.0k $\Omega$ (+/- 1%) resistor is attached from ground to this pin to set the transceiver's internal bias settings.
<b>SERIAL PORT INTERFACE</b>			
SDA/ SMBDATA/ NON_REM1	22	I/OSD12	Serial Data / SMB Data & Port Non-removable Strap Option NON_REM1: Non-removable port strap option.  If this strap is enabled by package and configuration settings (see Table 3.2), this pin will be sampled (in conjunction with LOCAL_PWR/SUSP_IND/NON_REM0) at RESET_N negation to determine if ports [2:1] contain permanently attached (non-removable) devices:  NON_REM[1:0] = '00', All ports are removable. NON_REM[1:0] = '01', Port 1 is non-removable. NON_REM[1:0] = '10', Ports 1 & 2 are non-removable. NON_REM[1:0] = '11', Ports 1 & 2 are non-removable.
SCL/ SMBCLK/ CFG_SEL0	24	I/OSD12	Serial Clock (SCL) SMBus Clock (SMBCLK) Configuration Select_SEL0: The logic state of this multifunction pin is internally latched on the rising edge of RESET_N (RESET_N negation), and will determine the Hub configuration method as described in Table 3.2, "SMBus or EEPROM Interface Behavior".
HS_IND/ CFG_SEL1	25	I/O12	Hi-Speed Upstream port indicator & Configuration Programming Select HS_IND: High Speed Indicator for upstream port connection speed. The active state of the LED will be determined as follows: CFG_SEL1 = '0', HS_IND is active high, CFG_SEL1 = '1', HS_IND is active low,  'Asserted' = Hub is connected at HS 'Negated' = Hub is connected at FS  CFG_SEL1: The logic state of this pin is internally latched on the rising edge of RESET_N (RESET_N negation), and will determine the Hub configuration method as described in Table 3.2, "SMBus or EEPROM Interface Behavior".
<b>MISC</b>			
XTAL1/ CLKIN	33	ICLKx	Crystal Input/External Clock Input 24MHz crystal or external clock input. This pin connects to either one terminal of the crystal or to an external 24MHz clock when a crystal is not used.

Table 3.1 USB2512A Pin Descriptions (continued)

SYMBOL	QFN-36 EMB	BUFFER TYPE	DESCRIPTION
XTAL2	32	OCLKx	Crystal Output 24MHz Crystal This is the other terminal of the crystal, or a NO CONNECT when an external clock source is used to drive XTAL1/CLKIN.  <b>Note:</b> This output must not be used to drive any external circuitry other than the crystal circuit.
RESET_N	26	IS	RESET Input The system can reset the chip by driving this input low. The minimum active low pulse is 1 us.  When the RESET_N pin is pulled to VDD33, the internal POR (Power on Reset) is enabled and no external reset circuitry is required. The internal POR holds the internal logic in reset until the power supplies are stable.
SUSP_IND/ LOCAL_PWR/ NON_REM0	28	I/O	Active/Suspend status LED or Local-Power & Non-removable Strap Option  Suspend Indicator: Indicates USB state of the hub. 'negated' = Unconfigured, or configured and in USB Suspend 'asserted' = Hub is configured, and is active (i.e., not in suspend)  Local Power: Detects availability of local self-power source. Low = Self/local power source is NOT available (i.e., Hub gets all power from Upstream USB VBus). High = Self/local power source is available.  NON_REM0 Strap Option: If this strap is enabled by package and configuration settings (see Table 3.2), this pin will be sampled (in conjunction with NON_REM1) at RESET_N negation to determine if ports [2:1] contain permanently attached (non-removable) devices. Also, the active state of the LED will be determined as follows:  NON_REM[1:0] = '00', All ports are removable, and the LED is active high  NON_REM[1:0] = '01', Port 1 is non-removable, and the LED is active low  NON_REM[1:0] = '10', Ports 1 & 2 are non-removable, and the LED is active high  NON_REM[1:0] = '11', Ports 1 & 2 are non-removable, and the LED is active low
TEST	11	IPD	TEST pin  XNOR continuity tests all signal pins on the hub. Please contact your SMSC representative for a detailed description of how this test mode is enabled and utilized.

**Table 3.2 SMBus or EEPROM Interface Behavior**

**Table 3.3 USB2512A Power, Ground, and No Connect**

PACKAGE SYMBOL	36-QFN EMB	FUNCTION
VDD18	14	VDD Core This pin must have a 1.0μF (or greater) ±20% (ESR <0.1Ω) capacitor to VSS.
VDD33PLL	36	VDD 3.3 PLL Regulator Reference +3.3V power supply for the PLL. If the internal PLL 1.8V regulator is enabled, then this pin acts as the regulator input.
VDDPLL18	34	VDD PLL This pin must have a 1.0μF (or greater) ±20% (ESR <0.1Ω) capacitor to VSS.
VDDA33	5 10 29	VDD Analog I/O +3.3V Filtered analog PHY power, shared between adjacent ports.
VDD33/VDD33CR	23 15	VDDIO/VDD 3.3 Core Regulator Reference +3.3V power supply for the Digital I/O If the internal core regulator is enabled, then VDD33CR acts as the regulator input.
NC	6 7 8 9 18 19 20 21	No Connect No trace or signal should be routed or attached to these pins.

## 3.2 Buffer Type Descriptions

**Table 3.4 USB2512A Buffer Type Descriptions**

BUFFER	DESCRIPTION
I	Input.
IPD	Input with internal weak pull-down resistor.
IPU	Input with internal weak pull-up resistor.
IS	Input with Schmitt trigger.
O12	Output 12mA.
OD12	Open drain with 12mA sink.
I/O12	Input/Output buffer with 12mA sink and 12mA source.
I/OSD12	Open drain with Schmitt trigger and 12mA sink. Must meet I <sup>2</sup> C-Bus Specification Version 2.1 requirements.
ICLKx	XTAL clock input.
OCLKx	XTAL clock output.
I-R	RBIAS.
I/O-U	Analog Input/Output Defined in USB specification.
AIO	Analog Input/Output.

## Chapter 4 Configuration Options

### 4.1 2-Port Hub

SMSC's USB 2.0 2-Port Hub is fully specification compliant to the Universal Serial Bus Specification Revision 2.0 April 27,2000 (12/7/2000 and 5/28/2002 Errata). Please reference Chapter 10 (Hub Specification) for general details regarding Hub operation and functionality.

The 2-Port Hub provides 1 Transaction Translator (TT) that is shared by both downstream ports (defined as Single-TT configuration), The TT contains 4 non-periodic buffers.

#### 4.1.1 Hub Configuration Options

The SMSC Hub supports a large number of features (some are mutually exclusive), and must be configured in order to correctly function when attached to a USB host controller. There are three principal ways to configure the hub: SMBus, EEPROM, or by internal default settings (with or without pin strapping option over-rides). In all cases, the configuration method will be determined by the CFG\_SEL1 and CFG\_SEL0 pins immediately after RESET\_N negation.

##### 4.1.1.1 Power Switching Polarity

The hub only supports "active high" port power controllers.

##### 4.1.2 VBus Detect

According to Section 7.2.1 of the USB 2.0 Specification, a downstream port can never provide power to its D+ or D- pull-up resistors unless the upstream port's VBUS is in the asserted (powered) state. The VBUS\_DET pin on the Hub monitors the state of the upstream VBUS signal and will not pull-up the D+ resistor if VBUS is not active. If VBUS goes from an active to an inactive state (Not Powered), the Hub will remove power from the D+ pull-up resistor within 10 seconds.

### 4.2 EEPROM Interface

The SMSC Hub can be configured via a 2-wire (I<sup>2</sup>C) EEPROM (256x8). (Please see [Table 3.1](#) for specific details on how to enable configuration via an I<sup>2</sup>C EEPROM).

The Internal state-machine will (when configured for EEPROM support) read the external EEPROM for configuration data. The hub will then "attach" to the upstream USB host.

Note: The Hub does not have the capacity to write, or "Program," an external EEPROM. The Hub only has the capability to read external EEPROMs. The external eeprom will be read (even if it is blank or non-populated), and the hub will be "configured" with the values that are read.

Please see Internal Register Set (Common to EEPROM and SMBus) for a list of data fields available.

#### 4.2.1 Internal Register Set (Common to EEPROM and SMBus)

Table 4.1 Internal Default, EEPROM and SMBus Register Memory Map

#### 4.2.1.1 Register 00h: Vendor ID (LSB)

BIT NUMBER	BIT NAME	DESCRIPTION
7:0	VID_LSB	Least Significant Byte of the Vendor ID. This is a 16-bit value that uniquely identifies the Vendor of the user device (assigned by USB-Interface Forum). This field is set by the OEM using either the SMBus or EEPROM interface options.

#### 4.2.1.2 Register 01h: Vendor ID (MSB)

BIT NUMBER	BIT NAME	DESCRIPTION
7:0	VID_MSB	Most Significant Byte of the Vendor ID. This is a 16-bit value that uniquely identifies the Vendor of the user device (assigned by USB-Interface Forum). This field is set by the OEM using either the SMBus or EEPROM interface options.

#### 4.2.1.3 Register 02h: Product ID (LSB)

BIT NUMBER	BIT NAME	DESCRIPTION
7:0	PID_LSB	Least Significant Byte of the Product ID. This is a 16-bit value that the Vendor can assign that uniquely identifies this particular product (assigned by OEM). This field is set by the OEM using either the SMBus or EEPROM interface options.

#### 4.2.1.4 Register 03h: Product ID (MSB)

BIT NUMBER	BIT NAME	DESCRIPTION
7:0	PID_MSB	Most Significant Byte of the Product ID. This is a 16-bit value that the Vendor can assign that uniquely identifies this particular product (assigned by OEM). This field is set by the OEM using either the SMBus or EEPROM interface options.

#### 4.2.1.5 Register 04h: Device ID (LSB)

BIT NUMBER	BIT NAME	DESCRIPTION
7:0	DID_LSB	Least Significant Byte of the Device ID. This is a 16-bit device release number in BCD format (assigned by OEM). This field is set by the OEM using either the SMBus or EEPROM interface options.

#### 4.2.1.6 Register 05h: Device ID (MSB)

BIT NUMBER	BIT NAME	DESCRIPTION
7:0	DID_MSB	Most Significant Byte of the Device ID. This is a 16-bit device release number in BCD format (assigned by OEM). This field is set by the OEM using either the SMBus or EEPROM interface options.

**4.2.1.7 Register 06h: CONFIG\_BYTE\_1**

BIT NUMBER	BIT NAME	DESCRIPTION
7	SELF_BUS_PWR	<p>Self or Bus Power: Selects between Self- and Bus-Powered operation.</p> <p>The Hub is either Self-Powered (draws less than 2mA of upstream bus power) or Bus-Powered (limited to a 100mA maximum of upstream power prior to being configured by the host controller).</p> <p>When configured as a Bus-Powered device, the SMSC Hub consumes less than 100mA of current prior to being configured. After configuration, the Bus-Powered SMSC Hub (along with all associated hub circuitry, any embedded devices if part of a compound device, and 100mA per externally available downstream port) must consume no more than 500mA of upstream VBUS current. The current consumption is system dependent, and the OEM must ensure that the USB 2.0 specifications are not violated.</p> <p>When configured as a Self-Powered device, &lt;1mA of upstream VBUS current is consumed and all ports are available, with each port being capable of sourcing 500mA of current.</p> <p>This field is set by the OEM using either the SMBus or EEPROM interface options.</p> <p>Please see the description under Dynamic Power for the self/bus power functionality when dynamic power switching is enabled.</p> <p>0 = Bus-Powered operation 1 = Self-Powered operation</p> <p>Note: If Dynamic Power Switching is enabled, this bit is ignored and the LOCAL_PWR pin is used to determine if the hub is operating from self or bus power.</p>
6	Reserved	Reserved
5	HS_DISABLE	<p>High Speed Disable: Disables the capability to attach as either a High/Full-speed device, and forces attachment as Full-speed only (i.e. no Hi-Speed support).</p> <p>0 = High-/Full-Speed 1 = Full-Speed-Only (Hi-Speed disabled!)</p>
4	Reserved	Reserved
3	EOP_DISABLE	<p>EOP Disable: Disables EOP generation of EOF1 when in Full-Speed mode. During FS operation only, this permits the Hub to send EOP if no downstream traffic is detected at EOF1. See Section 11.3.1 of the USB 2.0 Specification for additional details. Note: generation of an EOP at the EOF1 point may prevent a Host controller (operating in FS mode) from placing the USB bus in suspend.</p> <p>0 = EOP generation is normal 1 = EOP generation is disabled</p>
2:1	CURRENT_SNS	<p>Over Current Sense: Selects current sensing on a port-by-port basis, all ports ganged, or none (only for bus-powered hubs). The ability to support current sensing on a port or ganged basis is hardware implementation dependent.</p> <p>00 = Ganged sensing (all ports together) 01 = Individual port-by-port 1x = Over current sensing not supported (must only be used with Bus-Powered configurations!)</p>

## Datasheet

BIT NUMBER	BIT NAME	DESCRIPTION
0	PORT_PWR	<p>Port Power Switching: Enables power switching on all ports simultaneously (ganged), or port power is individually switched on and off on a port- by-port basis (individual). The ability to support power enabling on a port or ganged basis is hardware implementation dependent.</p> <p>0 = Ganged switching (all ports together) 1 = Individual port-by-port switching</p>

## 4.2.1.8 Register 07h: Configuration Data Byte 2

BIT NUMBER	BIT NAME	DESCRIPTION
7	DYNAMIC	<p>Dynamic Power Enable: Controls the ability of the Hub to automatically change from Self-Powered operation to Bus-Powered operation if the local power source is removed or is unavailable (and from Bus-Powered to Self-Powered if the local power source is restored). {Note: If the local power source is available, the Hub will always switch to Self-Powered operation.}</p> <p>When Dynamic Power switching is enabled, the Hub detects the availability of a local power source by monitoring the external LOCAL_PWR pin. If the Hub detects a change in power source availability, the Hub immediately disconnects and removes power from all downstream devices and disconnects the upstream port. The Hub will then re-attach to the upstream port as either a Bus-Powered Hub (if local-power is unavailable) or a Self-Powered Hub (if local power is available).</p> <p>0 = No Dynamic auto-switching 1 = Dynamic Auto-switching capable</p>
6	Reserved	Reserved
5:4	OC_TIMER	<p>OverCurrent Timer: Over Current Timer delay.</p> <p>00 = 0.1ms 01 = 4ms 10 = 8ms 11 = 16ms</p>
3	COMPOUND	<p>Compound Device: Allows the OEM to indicate that the Hub is part of a compound (see the USB Specification for definition) device. The applicable port(s) must also be defined as having a "Non-Removable Device".</p> <p>Note: When configured via strapping options, declaring a port as non-removable automatically causes the hub controller to report that it is part of a compound device.</p> <p>0 = No 1 = Yes, Hub is part of a compound device</p>

**4.2.1.13 Register 0Ch: Max Power For Self Powered Operation**

BIT NUMBER	BIT NAME	DESCRIPTION
7:0	MAX_PWR_SP	<p>Max Power Self_Powered: Value in 2mA increments that the Hub consumes from an upstream port (VBUS) when operating as a self-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value also includes the power consumption of a permanently attached peripheral if the hub is configured as a compound device, and the embedded peripheral reports 0mA in its descriptors.</p> <p><b>Note:</b> The USB 2.0 Specification does not permit this value to exceed 100mA</p>

**4.2.1.14 Register 0Dh: Max Power For Bus Powered Operation**

BIT NUMBER	BIT NAME	DESCRIPTION
7:0	MAX_PWR_BP	<p>Max Power Bus_Powered: Value in 2mA increments that the Hub consumes from an upstream port (VBUS) when operating as a bus-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value also includes the power consumption of a permanently attached peripheral if the hub is configured as a compound device, and the embedded peripheral reports 0mA in its descriptors.</p>

**4.2.1.15 Register 0Eh: Hub Controller Max Current For Self Powered Operation**

BIT NUMBER	BIT NAME	DESCRIPTION
7:0	HC_MAX_C_SP	<p>Hub Controller Max Current Self-Powered: Value in 2mA increments that the Hub consumes from an upstream port (VBUS) when operating as a self-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value does NOT include the power consumption of a permanently attached peripheral if the hub is configured as a compound device.</p> <p><b>Note:</b> The USB 2.0 Specification does not permit this value to exceed 100mA</p> <p>A value of 50 (decimal) indicates 100mA, which is the default value.</p>

## Datasheet

## 4.2.1.16 Register 0Fh: Hub Controller Max Current For Bus Powered Operation

BIT NUMBER	BIT NAME	DESCRIPTION
7:0	HC_MAX_C_BP	Hub Controller Max Current Bus-Powered: Value in 2mA increments that the Hub consumes from an upstream port (VBUS) when operating as a bus-powered hub. This value will include the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value will NOT include the power consumption of a permanently attached peripheral if the hub is configured as a compound device.  A value of 50 (decimal) would indicate 100mA, which is the default value.

## 4.2.1.17 Register 10h: Power-On Time

BIT NUMBER	BIT NAME	DESCRIPTION
7:0	POWER_ON_TIME	Power On Time: The length of time that it takes (in 2 ms intervals) from the time the host initiated power-on sequence begins on a port until power is good on that port.

## 4.2.1.18 Register F6h: Boost\_Up

BIT NUMBER	BIT NAME	DESCRIPTION
7:2	Reserved	Reserved
1:0	BOOST_IOUT	USB electrical signaling drive strength Boost Bit for the Upstream Port.  '00' = Normal electrical drive strength = No boost '01' = Elevated electrical drive strength = Low (approximately 4% boost) '10' = Elevated electrical drive strength = Medium (approximately 8% boost) '11' = Elevated electrical drive strength = High (approximately 12% boost)  <b>Note:</b> "Boost" could result in non-USB Compliant parameters (one example would be Test J/K levels), the OEM should use a 00 value unless specific implementation issues require additional signal boosting to correct for degraded USB signalling levels.

## 4.2.1.19 Register F8h: Boost\_2:0

BIT NUMBER	BIT NAME	DESCRIPTION
7:4	Reserved	Reserved

BIT NUMBER	BIT NAME	DESCRIPTION
3:2	BOOST_IOUT_2	USB electrical signaling drive strength Boost Bit for Downstream Port '2'. '00' = Normal electrical drive strength = No boost '01' = Elevated electrical drive strength = Low (approximately 4% boost) '10' = Elevated electrical drive strength = Medium (approximately 8% boost) '11' = Elevated electrical drive strength = High (approximately 12% boost) <b>Note:</b> "Boost" could result in non-USB Compliant parameters (one example would be Test J/K levels), the OEM should use a 00 value unless specific implementation issues require additional signal boosting to correct for degraded USB signalling levels.
1:0	BOOST_IOUT_1	USB electrical signaling drive strength Boost Bit for Downstream Port '1'. '00' = Normal electrical drive strength = No boost '01' = Elevated electrical drive strength = Low (approximately 4% boost) '10' = Elevated electrical drive strength = Medium (approximately 8% boost) '11' = Elevated electrical drive strength = High (approximately 12% boost) <b>Note:</b> "Boost" could result in non-USB Compliant parameters (one example would be Test J/K levels), the OEM should use a 00 value unless specific implementation issues require additional signal boosting to correct for degraded USB signalling levels.

#### 4.2.1.20 Register FAh: Port Swap

BIT NUMBER	BIT NAME	DESCRIPTION
7:0	PRTSP	Port Swap: Swaps the Upstream and Downstream USB DP and DM Pins for ease of board routing to devices and connectors. '0' = USB D+ functionality is associated with the DP pin and D- functionality is associated with the DM pin. '1' = USB D+ functionality is associated with the DM pin and D- functionality is associated with the DP pin. Bit 7= Reserved Bit 6= Reserved Bit 5= Reserved Bit 4= Reserved Bit 3= Reserved Bit 2= '1'; Port 2 DP/DM is Swapped. Bit 1= '1': Port 1 DP/DM is Swapped. Bit 0= '1':Upstream Port DP/DM is Swapped

4.2.1.21 Register FBh: Port Remap 12

BIT NUMBER	BIT NAME	DESCRIPTION																								
7:0	PRTR12	<p>Port remap register for ports 1 &amp; 2.</p> <p>When a hub is enumerated by a USB Host Controller, the hub is only permitted to report how many ports it has; the hub is not permitted to select a numerical range or assignment. The Host Controller will number the downstream ports of the hub starting with the number '1', up to the number of ports that the hub reported having.</p> <p>The host's port number is referred to as "Logical Port Number" and the physical port on the hub is the "Physical Port Number". When remapping mode is enabled (see PRTMAP_EN in Register 08h: Configuration Data Byte 3) the hub's downstream port numbers can be remapped to different logical port numbers (assigned by the host).</p> <p><b>Note:</b> The OEM must ensure that Contiguous Logical Port Numbers are used, starting from #1 up to the maximum number of enabled ports; this ensures that the hub's ports are numbered in accordance with the way a Host will communicate with the ports.</p> <p style="text-align: center;"><b>Table 4.2 Port Remap Register for Ports 1 &amp; 2</b></p> <table border="1" data-bbox="602 909 1421 1417"> <tbody> <tr> <td data-bbox="602 909 816 961">Bit [7:4]</td> <td data-bbox="816 909 938 961">'0000'</td> <td data-bbox="938 909 1421 961">Physical Port 2 is Disabled</td> </tr> <tr> <td data-bbox="602 961 816 1014"></td> <td data-bbox="816 961 938 1014">'0001'</td> <td data-bbox="938 961 1421 1014">Physical Port 2 is mapped to Logical Port 1</td> </tr> <tr> <td data-bbox="602 1014 816 1066"></td> <td data-bbox="816 1014 938 1066">'0010'</td> <td data-bbox="938 1014 1421 1066">Physical Port 2 is mapped to Logical Port 2</td> </tr> <tr> <td data-bbox="602 1066 816 1161"></td> <td data-bbox="816 1066 938 1161">'0011' to '1111'</td> <td data-bbox="938 1066 1421 1161">Illegal; Do Not Use</td> </tr> <tr> <td data-bbox="602 1161 816 1213">Bit [3:0]</td> <td data-bbox="816 1161 938 1213">'0000'</td> <td data-bbox="938 1161 1421 1213">Physical Port 1 is Disabled</td> </tr> <tr> <td data-bbox="602 1213 816 1266"></td> <td data-bbox="816 1213 938 1266">'0001'</td> <td data-bbox="938 1213 1421 1266">Physical Port 1 is mapped to Logical Port 1</td> </tr> <tr> <td data-bbox="602 1266 816 1318"></td> <td data-bbox="816 1266 938 1318">'0010'</td> <td data-bbox="938 1266 1421 1318">Physical Port 1 is mapped to Logical Port 2</td> </tr> <tr> <td data-bbox="602 1318 816 1417"></td> <td data-bbox="816 1318 938 1417">'0011' to '1111'</td> <td data-bbox="938 1318 1421 1417">Illegal; Do Not Use</td> </tr> </tbody> </table>	Bit [7:4]	'0000'	Physical Port 2 is Disabled		'0001'	Physical Port 2 is mapped to Logical Port 1		'0010'	Physical Port 2 is mapped to Logical Port 2		'0011' to '1111'	Illegal; Do Not Use	Bit [3:0]	'0000'	Physical Port 1 is Disabled		'0001'	Physical Port 1 is mapped to Logical Port 1		'0010'	Physical Port 1 is mapped to Logical Port 2		'0011' to '1111'	Illegal; Do Not Use
Bit [7:4]	'0000'	Physical Port 2 is Disabled																								
	'0001'	Physical Port 2 is mapped to Logical Port 1																								
	'0010'	Physical Port 2 is mapped to Logical Port 2																								
	'0011' to '1111'	Illegal; Do Not Use																								
Bit [3:0]	'0000'	Physical Port 1 is Disabled																								
	'0001'	Physical Port 1 is mapped to Logical Port 1																								
	'0010'	Physical Port 1 is mapped to Logical Port 2																								
	'0011' to '1111'	Illegal; Do Not Use																								

#### 4.2.1.22 Register FFh: Status/Command

BIT NUMBER	BIT NAME	DESCRIPTION
7:3	Reserved	Reserved
2	INTF_PW_DN	SMBus Interface Power Down '0' = Interface is active '1' = Interface power down after ACK has completed
1	RESET	Reset the SMBus Interface and internal memory back to RESET_N assertion default settings. '0' = Normal Run/Idle State '1' = Force a reset of registers to their default state
0	USB_ATTACH	USB Attach (and write protect) '0' = SMBus slave interface is active '1' = Hub will signal a USB attach event to an upstream device, and the internal memory (address range 00h-FEh) is "write-protected" to prevent unintentional data corruption.

## 4.2.2 I<sup>2</sup>C EEPROM

The I<sup>2</sup>C EEPROM interface implements a subset of the I<sup>2</sup>C Master Specification (Please refer to the Philips Semiconductor Standard I<sup>2</sup>C-Bus Specification for details on I<sup>2</sup>C bus protocols). The Hub's I<sup>2</sup>C EEPROM interface is designed to attach to a single "dedicated" I<sup>2</sup>C EEPROM, and it conforms to the Standard-mode I<sup>2</sup>C Specification (100kbit/s transfer rate and 7-bit addressing) for protocol and electrical compatibility.

**Note:** Extensions to the I<sup>2</sup>C Specification are not supported.

The Hub acts as the master and generates the serial clock SCL, controls the bus access (determines which device acts as the transmitter and which device acts as the receiver), and generates the START and STOP conditions.

### 4.2.2.1 Implementation Characteristics

The Hub will only access an EEPROM using the Sequential Read Protocol.

### 4.2.2.2 Pull-Up Resistor

The Circuit board designer is required to place external pull-up resistors (10KΩ recommended) on the SDA/SMBDATA & SCL/SMBCLK/CFG\_SELO lines (per SMBus 1.0 Specification, and EEPROM manufacturer guidelines) to Vcc in order to assure proper operation.

### 4.2.2.3 I<sup>2</sup>C EEPROM Slave Address

Slave address is 1010000.

**Note:** 10-bit addressing is NOT supported.

### 4.2.3 In-Circuit EEPROM Programming

The EEPROM can be programmed via ATE by pulling RESET\_N low (which tri-states the Hub's EEPROM interface and allows an external source to program the EEPROM).

## 4.3 SMBus Slave Interface

Instead of loading User-Defined Descriptor data from an external EEPROM, the SMSC Hub can be configured to receive a code load from an external processor via an SMBus interface. The SMBus interface shares the same pins as the EEPROM interface; if CFG\_SEL1 & CFG\_SEL0 activates the SMBus interface, external EEPROM support is no longer available (and the user-defined descriptor data must be downloaded via the SMBus). Due to system issues, the SMSC Hub waits indefinitely for the SMBus code load to complete and only "appears" as a newly connected device on USB after the code load is complete.

The Hub's SMBus implementation is a subset of the SMBus interface to the host. The device is a *slave-only* SMBus device. The implementation in the device is a subset of SMBus since it only supports two protocols.

The Write Block and Read Block protocols are the only valid SMBus protocols for the Hub. The Hub responds to other protocols as described in [Section 4.3.2, "Invalid Protocol Response Behavior," on page 26](#). Reference the System Management Bus Specification, Rev 1.0.

The SMBus interface is used to read and write the registers in the device. The register set is shown in [Section 4.2.1, "Internal Register Set \(Common to EEPROM and SMBus\)," on page 13](#).

### 4.3.1 Bus Protocols

Typical Write Block and Read Block protocols are shown below. Register accesses are performed using 7-bit slave addressing, an 8-bit register address field, and an 8-bit data field. The shading indicates the Hub driving data on the SMBDATA line; otherwise, host data is on the SDA/SMBDATA line.

The slave address is the unique SMBus Interface Address for the Hub that identifies it on SMBus. The register address field is the internal address of the register to be accessed. The register data field is the data that the host is attempting to write to the register or the contents of the register that the host is attempting to read.

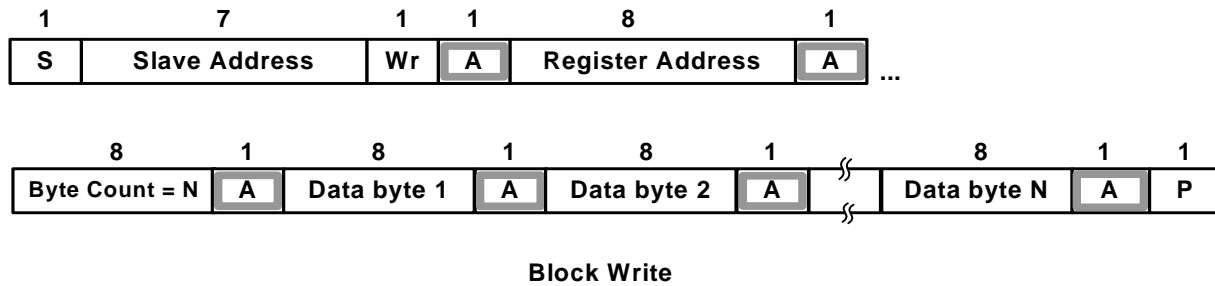

**Note:** Data bytes are transferred MSB first (msb first).

#### 4.3.1.1 Block Read/Write

The Block Write begins with a slave address and a write condition. After the command code, the host issues a byte count which describes how many more bytes will follow in the message. If a slave had 20 bytes to send, the first byte would be the number 20 (14h), followed by the 20 bytes of data. The byte count may not be 0. A Block Read or Write is allowed to transfer a maximum of 32 data bytes.

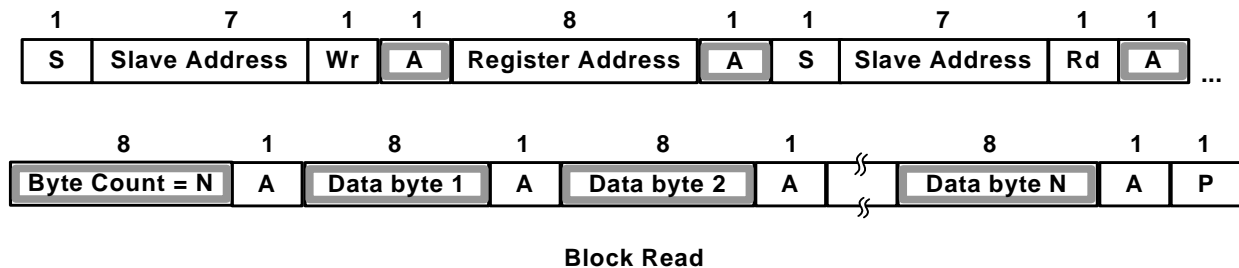

**Note:** For the following SMBus tables:

 Denotes Master-to-Slave       Denotes Slave-to-Master

**Figure 4.1 Block Write**

Block Read

A Block Read differs from a block write in that the repeated start condition exists to satisfy the I<sup>2</sup>C specification's requirement for a change in the transfer direction.

**Figure 4.2 Block Read**

### 4.3.2 Invalid Protocol Response Behavior

Registers that are accessed with an invalid protocol are not updated. A register is only updated following a valid protocol. The only valid protocols are Write Block and Read Block, which are described above.

The Hub only responds to the hardware selected Slave Address.

Attempting to communicate with the Hub over SMBus with an invalid slave address or invalid protocol results in no response, and the SMBus Slave Interface returns to the idle state.

The only valid registers that are accessible by the SMBus slave address are the registers defined in the Registers Section. See [Section 4.3.3](#) for the response to undefined registers.

### 4.3.3 General Call Address Response

The Hub does not respond to a general call address of 0000\_000b.

### 4.3.4 Slave Device Time-Out

According to the SMBus Specification, V1.0 devices in a transfer can abort the transfer in progress and release the bus when any single clock low interval exceeds 25ms ( $T_{\text{TIMEOUT, MIN}}$ ). Devices that have detected this condition must reset their communication and be able to receive a new START condition no later than 35ms ( $T_{\text{TIMEOUT, MAX}}$ ).

**Note:** Some simple devices do not contain a clock low drive circuit; this simple kind of device typically resets its communications port after a start or stop condition. The Slave Device Time-Out must be implemented.

## Datasheet

### 4.3.5 Stretching the SCLK Signal

The Hub supports stretching of the SCLK by other devices on the SMBus. The Hub does not stretch the SCLK.

### 4.3.6 SMBus Timing

The SMBus Slave Interface complies with the SMBus AC Timing Specification. See the SMBus timing in the "Timing Diagram" section.

### 4.3.7 Bus Reset Sequence

The SMBus Slave Interface resets and returns to the idle state upon a START field followed immediately by a STOP field.

### 4.3.8 SMBus Alert Response Address

The SMBALERT# signal is not supported by the Hub.

#### 4.3.8.1 Undefined Registers

The registers shown in [Table 4.1](#) are the defined registers in the Hub. Reads to undefined registers return 00h. Writes to undefined registers have no effect and do not return an error.

#### 4.3.8.2 Reserved Registers

Unless otherwise instructed, only a '0' may be written to all reserved registers or bits.

## 4.4 Default Configuration Option:

The SMSC Hub can be configured via its internal default configuration. (please see [Section 4.2.1, "Internal Register Set \(Common to EEPROM and SMBus\)"](#) for specific details on how to enable default configuration.)

Please refer to [Table 4.1](#) for the internal default values that are loaded when this option is selected.

## 4.5 Default Strapping Options:

The USB2512A can be configured via a combination of internal default values and pin strap options. Please see [Table 3.1](#) and [Table 3.2](#) for specific details on how to enable the default/pin-strap configuration option.

The strapping option pins only cover a limited sub-set of the configuration options. The internal default values will be used for the bits & registers that are not controlled by a strapping option pin. Please refer to [Table 4.1](#) for the internal default values that are loaded when this option is selected.

## 4.6 Reset

There are two different resets that the Hub experiences. One is a hardware reset (either from the internal POR reset circuit or via the RESET\_N pin) and the second is a USB Bus Reset.

### 4.6.1 Internal POR Hardware Reset

All reset timing parameters are guaranteed by design.

## 4.6.2 External Hardware RESET\_N

A valid hardware reset is defined as assertion of RESET\_N for a minimum of 1us after all power supplies are within operating range. While reset is asserted, the Hub (and its associated external circuitry) consumes less than 500μA of current from the upstream USB power source.

Assertion of RESET\_N (external pin) causes the following:

1. All downstream ports are disabled, and PRTPWR power to downstream devices is removed.
2. The PHYs are disabled, and the differential pairs will be in a high-impedance state.
3. All transactions immediately terminate; no states are saved.
4. All internal registers return to the default state (in most cases, 00(h)).
5. The external crystal oscillator is halted.
6. The PLL is halted.

The Hub is “operational” 500μs after RESET\_N is negated.

Once operational, the Hub immediately reads OEM-specific data from the external EEPROM (if the SMBus option is not disabled).

### 4.6.2.1 RESET\_N for Strapping Option Configuration

Figure 4.3 Reset\_N Timing for Default/Strap Option Mode

Table 4.3 Reset\_N Timing for Default/Strap Option Mode

NAME	DESCRIPTION	MIN	TYP	MAX	UNITS
t1	RESET_N Asserted.	1			μsec
t2	Strap Setup Time	16.7			nsec
t3	Strap Hold Time.	16.7		1400	nsec
t4	hub outputs driven to inactive logic states		1.5	2	μsec
t5	USB Attach (See Note).			100	msec
t6	Host acknowledges attach and signals USB Reset.	100			msec

**Table 4.3 Reset\_N Timing for Default/Strap Option Mode (continued)**

NAME	DESCRIPTION	MIN	TYP	MAX	UNITS
t7	USB Idle.		undefined		msec
t8	Completion time for requests (with or without data stage).			5	msec

**Notes:**

- When in Bus-Powered mode, the Hub and its associated circuitry must not consume more than 100mA from the upstream USB power source during t1+t5.
- All Power Supplies must have reached the operating levels mandated in [Chapter 5, DC Parameters](#), prior to (or coincident with) the assertion of RESET\_N.

**4.6.2.2 RESET\_N for EEPROM Configuration**

**Figure 4.4 Reset\_N Timing for EEPROM Mode**

**Table 4.4 Reset\_N Timing for EEPROM Mode**

NAME	DESCRIPTION	MIN	TYP	MAX	UNITS
t1	RESET_N Asserted.	1			μsec
t2	Hub Recovery/Stabilization.			500	μsec
t3	EEPROM Read / Hub Config.		2.0	99.5	msec
t4	USB Attach (See Note).			100	msec
t5	Host acknowledges attach and signals USB Reset.	100			msec
t6	USB Idle.		undefined		msec
t7	Completion time for requests (with or without data stage).			5	msec

**Notes:**

- When in Bus-Powered mode, the Hub and its associated circuitry must not consume more than 100mA from the upstream USB power source during t4+t5+t6+t7.
- All Power Supplies must have reached the operating levels mandated in [Chapter 5, DC Parameters](#), prior to (or coincident with) the assertion of RESET\_N.

### 4.6.2.3 RESET\_N for SMBus Slave Configuration

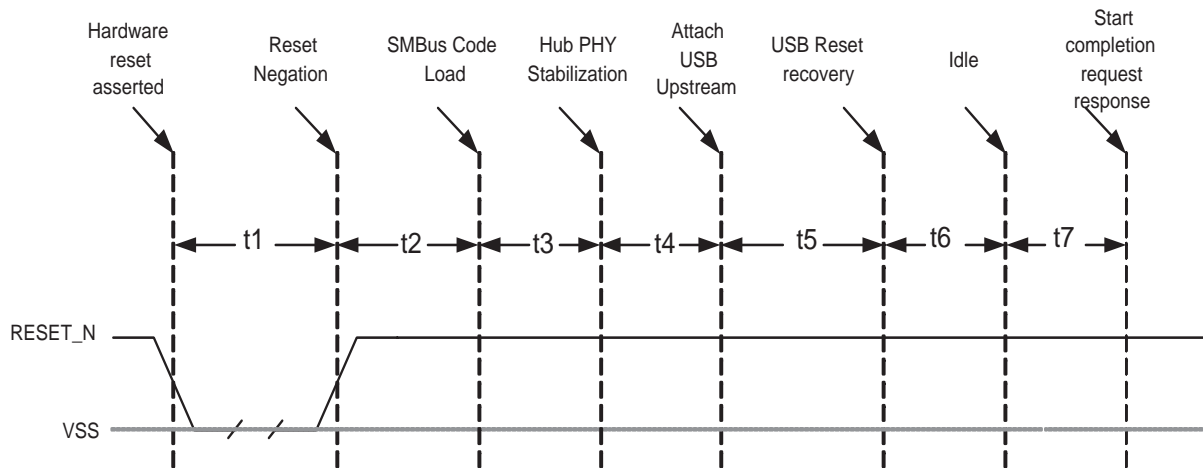

Figure 4.5 Reset\_N Timing for SMBus Mode

Table 4.5 Reset\_N Timing for SMBus Mode

NAME	DESCRIPTION	MIN	TYP	MAX	UNITS
t1	RESET_N Asserted.	1			μsec
t2	Hub Recovery/Stabilization.			500	μsec
t3	SMBus Code Load (See Note).		250	300	msec
t4	Hub Configuration and USB Attach.			100	msec
t5	Host acknowledges attach and signals USB Reset.	100			msec
t6	USB Idle.		Undefined		msec
t7	Completion time for requests (with or without data stage).			5	msec

**Notes:**

- For Bus-Powered configurations, the 99.5ms (MAX) is required, and the Hub and its associated circuitry must not consume more than 100mA from the upstream USB power source during t2+t3+t4+t5+t6+t7. For Self-Powered configurations, t3 MAX is not applicable and the time to load the configuration is determined by the external SMBus host.
- All Power Supplies must have reached the operating levels mandated in [Chapter 5, DC Parameters](#), prior to (or coincident with) the assertion of RESET\_N.

### 4.6.3 USB Bus Reset

In response to the upstream port signaling a reset to the Hub, the Hub does the following:

**Note:** The Hub does not propagate the upstream USB reset to downstream devices.

1. Sets default address to 0.
2. Sets configuration to: Unconfigured.
3. Negates PRTPWR[2:1] to all downstream ports.

**Datasheet**

4. Clears all TT buffers.
5. Moves device from suspended to active (if suspended).
6. Complies with Section 11.10 of the USB 2.0 Specification for behavior after completion of the reset sequence.

The Host then configures the Hub and the Hub's downstream port devices in accordance with the USB Specification.

## Chapter 5 DC Parameters

### 5.1 Maximum Guaranteed Ratings

PARAMETER	SYMBOL	MIN	MAX	UNITS	COMMENTS
Storage Temperature	$T_{\text{STOR}}$	-55	150	°C	
Lead Temperature			325	°C	Soldering < 10 seconds
1.8V supply voltage	$V_{\text{DDA18PLL}}$ , $V_{\text{DD18}}$		2.5	V	
3.3V supply voltage	$V_{\text{DDA33}}$ , $V_{\text{DD33PLL}}$ , $V_{\text{DD33}}$ , $V_{\text{DD33CR}}$		4.6	V	
Voltage on any I/O pin		-0.5	5.5	V	
Voltage on XTAL1		-0.5	4.0	V	
Voltage on XTAL2		-0.5	3.6	V	

**Note 5.1** Stresses above the specified parameters could cause permanent damage to the device. This is a stress rating only and functional operation of the device at any condition above those indicated in the operation sections of this specification is not implied.

**Note 5.2** When powering this device from laboratory or system power supplies, it is important that the Absolute Maximum Ratings not be exceeded or device failure can result. Some power supplies exhibit voltage spikes on their outputs when the AC power is switched on or off. In addition, voltage transients on the AC power line may appear on the DC output. When this possibility exists, it is suggested that a clamp circuit be used.

Figure 5.1 Supply Rise Time Model

## 5.2 Operating Conditions

PARAMETER	SYMBOL	MIN	MAX	UNITS	COMMENTS
Operating Temperature	$T_A$	0	70	°C	Ambient temperature in still air.
1.8V supply voltage	$V_{DDA18PLL}$ $V_{DD18}$	1.62	1.98	V	
3.3V supply voltage	$V_{DDA33}$ $V_{DDA33PLL}$ $V_{DD33}$ $V_{DD33CR}$	3.0	3.6	V	
3.3V supply rise time	$t_{RT}$	0	400	$\mu$ s	See <a href="#">Figure 5.1</a>
Voltage on any I/O pin		-0.3	5.5	V	If any 3.3V supply voltage drops below 3.0V, then the MAX becomes:  (3.3V supply voltage) + 0.5
Voltage on XTAL1		-0.3	$V_{DDA33}$	V	

Table 5.1 DC Electrical Characteristics

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	COMMENTS
<b>I, IS Type Input Buffer</b>						
Low Input Level	$V_{ILI}$			0.8	V	TTL Levels
High Input Level	$V_{IHI}$	2.0			V	
Input Leakage	$I_{IL}$	-10		+10	$\mu$ A	$V_{IN} = 0$ to $V_{DD33}$
Hysteresis ('IS' Only)	$V_{HYSI}$	250		350	mV	
<b>Input Buffer with Pull-Up (IPU)</b>						
Low Input Level	$V_{ILI}$			0.8	V	TTL Levels
High Input Level	$V_{IHI}$	2.0			V	
Low Input Leakage	$I_{ILL}$	+35		+90	$\mu$ A	$V_{IN} = 0$
High Input Leakage	$I_{IHL}$	-10		+10	$\mu$ A	$V_{IN} = V_{DD33}$
<b>Input Buffer with Pull-Down (IPD)</b>						
Low Input Level	$V_{ILI}$			0.8	V	TTL Levels
High Input Level	$V_{IHI}$	2.0			V	
Low Input Leakage	$I_{ILL}$	+10		-10	$\mu$ A	$V_{IN} = 0$
High Input Leakage	$I_{IHL}$	-35		-90	$\mu$ A	$V_{IN} = V_{DD33}$

**Table 5.1 DC Electrical Characteristics (continued)**

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	COMMENTS
<b>ICLK Input Buffer</b>						
Low Input Level	$V_{ILCK}$			0.5	V	
High Input Level	$V_{IHCK}$	1.4			V	
Input Leakage	$I_{IL}$	-10		+10	uA	$V_{IN} = 0$ to $V_{DD33}$
<b>O12, I/O12 &amp; I/OSD12 Type Buffer</b>						
Low Output Level	$V_{OL}$			0.4	V	$I_{OL} = 12\text{mA}$ @ $V_{DD33} = 3.3\text{V}$
High Output Level	$V_{OH}$	2.4			V	$I_{OH} = -12\text{mA}$ @ $V_{DD33} = 3.3\text{V}$
Output Leakage	$I_{OL}$	-10		+10	uA	$V_{IN} = 0$ to $V_{DD33}$ (Note 1)
Hysteresis ('SD' pad only)	$V_{HYSC}$	250		350	mV	
<b>IO-U</b> (Note 2)						
<b>Supply Current Unconfigured</b>						
Hi-Speed Host	$I_{CCINTHS}$		75	85	mA	
Full-Speed Host	$I_{CCINITFS}$		65	75	mA	
<b>Supply Current Configured</b> (Hi-Speed Host)						All supplies combined
1 Port HS, 1 Port LS/FS	$I_{HCH1C1}$		115	130	mA	
2 Ports @ LS/FS	$I_{HCC2}$		105	125	mA	
2 Ports @ HS	$I_{HCH2}$		125	180	mA	
<b>Supply Current Configured</b> (Full-Speed Host)						All supplies combined
1 Port	$I_{FCC1}$		95	115	mA	
2 Ports	$I_{FCC2}$		95	115	mA	
Supply Current Suspend	$I_{CSBY}$		300	400	μA	All supplies combined
Supply Current Reset	$I_{CRST}$		100	180	μA	All supplies combined

**Notes:**

- Output leakage is measured with the current pins in high impedance.
- See USB 2.0 Specification for USB DC electrical characteristics.

**CAPACITANCE**  $T_A = 25^\circ\text{C}$ ;  $f_c = 1\text{MHz}$ ;  $V_{DD18}, V_{DDPLL} = 1.8\text{V}$

**Table 5.2 Pin Capacitance**

PARAMETER	SYMBOL	LIMITS			UNIT	TEST CONDITION
		MIN	TYP	MAX		
Clock Input Capacitance	$C_{XTAL}$			2	pF	All pins except USB pins (and pins under test tied to AC ground)
Input Capacitance	$C_{IN}$			10	pF	
Output Capacitance	$C_{OUT}$			20	pF	

## Chapter 6 AC Specifications

### 6.1 Oscillator/Clock

Crystal: Parallel Resonant, Fundamental Mode, 24 MHz  $\pm$ 350ppm.

External Clock: 50% Duty cycle  $\pm$  10%, 24 MHz  $\pm$  350ppm, Jitter < 100ps rms.

Figure 6.1 Typical Crystal Circuit

**Note:**  $C_B$  equals total board/trace capacitance.

$$\frac{(C_1 + C_{S1}) \times (C_2 + C_{S2})}{(C_1 + C_{S1} + C_2 + C_{S2})} = C_L$$

Figure 6.2 Formula to find value of  $C_1$  and  $C_2$

#### 6.1.1 SMBus Interface:

The SMSC Hub conforms to all voltage, power, and timing characteristics and specifications as set forth in the SMBus 1.0 Specification for Slave-Only devices (except as noted in [Section 4.3](#)).

#### 6.1.2 I<sup>2</sup>C EEPROM:

Clock frequency is fixed at 60KHz  $\pm$  20%.

#### 6.1.3 USB 2.0

The SMSC Hub conforms to all voltage, power, and timing characteristics and specifications as set forth in the USB 2.0 Specification. Please refer to the USB 2.0 Specification for more information.

# Chapter 7 Package Outline

Revision 1.96 (07-11-08)

37  
 DATASHEET

LAND PATTERN DIMENSIONS			
SYMBOL	MIN	NOM	MAX
GD/GE	4.60	-	-
D2'/E2'	-	3.70	-
X	-	-	0.28
Y	-	-	0.90
e	0.50		

COMMON DIMENSIONS					
SYMBOL	MIN	NOM	MAX	NOTE	REMARK
A	0.80	-	1.00	-	OVERALL PACKAGE HEIGHT
A1	0	0.02	0.05	-	STANDOFF
A2	0.60	-	0.80	-	MOLD CAP THICKNESS
A3	0.20 REF		-	-	LEADFRAME THICKNESS
D/E	5.85	6.00	6.15	-	X/Y BODY SIZE
D1/E1	5.55	-	5.95	-	X/Y MOLD CAP SIZE
D2/E2	3.55	3.70	3.85	2	X/Y EXPOSED PAD SIZE
L	0.50	0.60	0.75	-	TERMINAL LENGTH
b	0.18	0.25	0.30	2	TERMINAL WIDTH
e	0.50 BSC			-	TERMINAL PITCH

- NOTES:**
- ALL DIMENSIONS ARE IN MILLIMETERS.
  - POSITION TOLERANCE OF EACH TERMINAL AND EXPOSED PAD IS  $\pm 0.05$ mm AT MAXIMUM MATERIAL CONDITION. DIMENSIONS 'b' APPLIES TO PLATED TERMINALS AND IT IS MEASURED BETWEEN 0.15 AND 0.30 mm FROM THE TERMINAL TIP.
  - DETAILS OF TERMINAL #1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE AREA INDICATED.
  - COPLANARITY ZONE APPLIES TO EXPOSED PAD AND TERMINALS.
