

FEATURES

- CLASS A OPERATION
- HIGH OUTPUT POWER
P_{OUT} = 26.5 dBm
G_{1dB} = 7 dB
- HIGH POWER ADDED EFFICIENCY

DESCRIPTION

The NE9000, NE9001, and NE9002 are 0.5 micron recessed gate medium power GaAs FETs for commercial and space amplifier and oscillator applications to 20 GHz. Chip configurations available are: the NE900000, a one cell die of 400 μm gate width; the NE900100, a one cell die of 750 μm gate width; and the NE900200, a two cell die of 1500 μm total gate width. The series is available in chip form or a variety of hermetic ceramic packages. The NE900000, NE900100, and NE900200 are standard die without wrap-around source-metallization, while the NE900000G, NE900100G, and NE900200G have wrap-around source metallization. The series is space qualified.

OUTLINE DIMENSIONS (Units in mm)**PACKAGE OUTLINE 75****NE900000 (CHIP)**
(Units in μm)

- Die Thickness: 110 to 160 μm
- Recommended Bonding Area.
 - Glassivated Area
 - Plated Wraparound (Optional)

POWER DERATING CURVE**PACKAGE OUTLINE 89A****NE900100/NE900200 (CHIP)***
(Units in μm)**HANDLING PRECAUTIONS****DIE ATTACHMENT**

Die attach can be accomplished with Au-Ge ($390 \pm 10^\circ\text{C}$) preforms in a forming gas environment. Epoxy die attach is not recommended.

BONDING

Gate and drain bonding wires should be semi-hard gold wire (3 to 8% elongation) 30 microns or less in diameter.

Bonding should be performed with a wedge tip that has a taper of approximately 15° . Die attach and bonding time should be kept to a minimum. As a general rule, the bonding operation should be kept within a 300°C to 10 minute curve. If longer periods are required, the tempera-

ture should be lowered.

PRECAUTIONS

The user must operate in a clean, dry environment. The chip channel is glassivated for mechanical protection only and does not preclude the necessity of a clean environment.

The bonding equipment should be periodically checked for sources of surge voltage and should be properly grounded at all times. In fact, all test and handling equipment should be grounded to minimize the possibilities of static discharge.
