32K x 36 Bit Synchronous Dual I/O, Dual Address SRAM

The MCM69D536 is a 1M-bit static random access memory, organized as 32K words of 36 bits. It features common data input and data output buffers and incorporates input and output registers on-board with high speed SRAM.

The MCM69D536 allows the user to concurrently perform reads, writes, or pass–through cycles in combination on the two data ports. The two address ports (AX, AY) determine the read or write locations for their respective data ports (DQX, DQY).

The synchronous design allows for precise cycle control with the use of an external single clock (K). All signal pins except output enables (GX, GY) are registered on the rising edge of clock (K).

The pass–through feature allows data to be passed from one port to the other, in either direction. The PTX input must be asserted to pass data from port X to port Y. The PTY will likewise pass data from port Y to port X. A pass–through operation takes precedence over a read operation.

For the case when AX and AY are the same, certain protocols are followed. If both ports are read, the reads occur normally. If one port is written and the other is read, the read from the array will occur before the data is written. If both ports are written, only the data on DQY will be written to the array.

- Single 3.3 V ± 5% Power Supply
- Fast Access Times: 6/8 ns Max
- · Throughput of 2.98 Gigabits/Second
- Single Clock Operation
- Address, Data Input, E1, E2, PTX, PTY, WX, WY, and Data Output Registers On-Chip
- 83 MHz Maximum Clock Frequency
- Self-Timed Write
- Two Bi-Directional Data Buses
- Can be Configured as Separate I/O
- Pass-Through Feature
- Asynchronous Output Enables (GX, GY)
- LVTTL Compatible I/O
- · Concurrent Reads and Writes
- 176-Pin TQFP Package

Suggested Applications

- ATM Ethernet Switches Routers
- Cell/Frame Buffers— SNA Switches— Shared Memory

Product Family Configurations

Operating Temperature	TA	0 to + 70	°C
Storage Temperature — Plastic	T _{stg}	- 55 to + 125	°C

NOTE: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to RECOMMENDED OPER-ATING CONDITIONS. Exposure to higher than recommended voltages for extended periods of time could affect device reliability.

This is a synchronous device. All synchronous inputs must meet specified setup and hold times with stable logic levels for *ALL* rising edges of clock (K) while the device is selected.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to these high–impedance circuits.
