Description

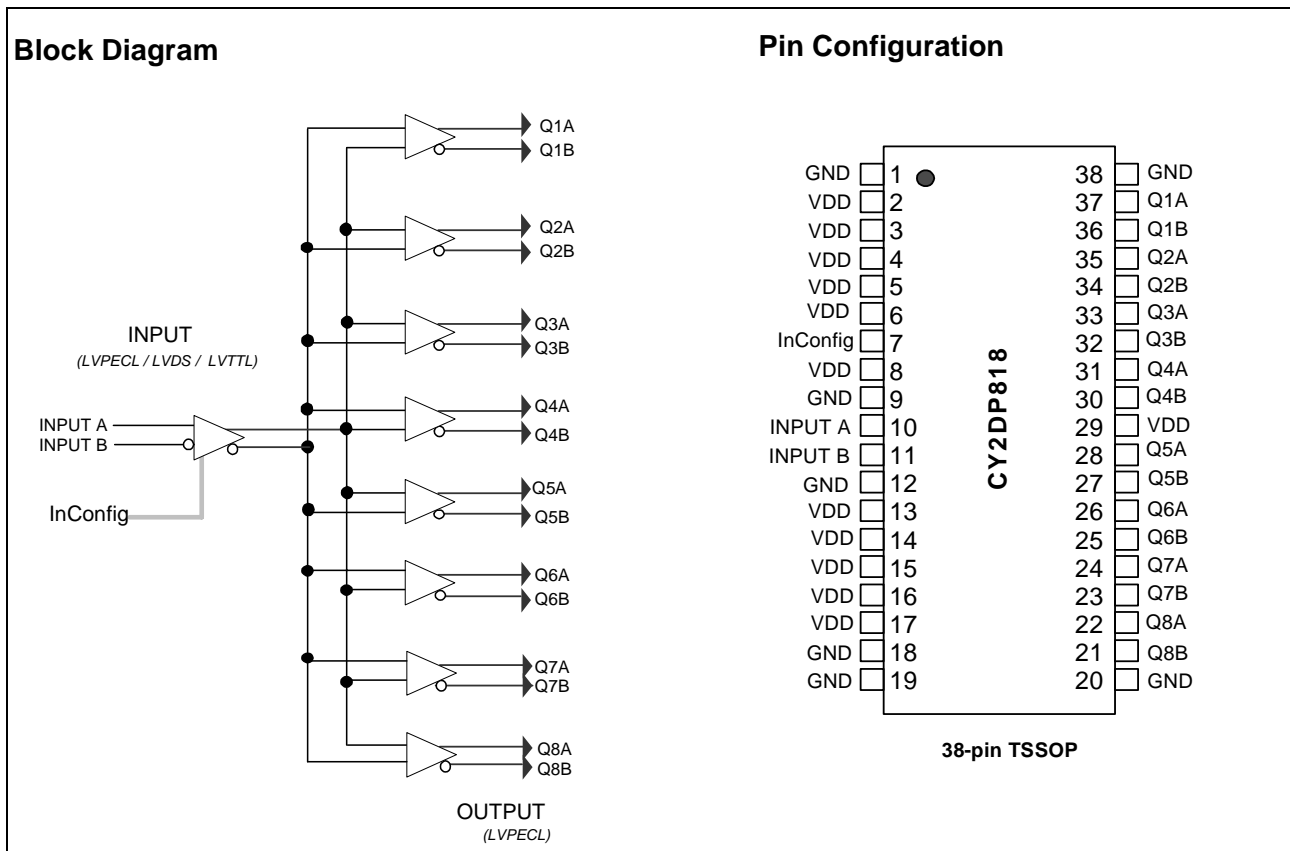

This Cypress series of network circuits are produced using advanced 0.35-micron CMOS technology, achieving the industry's fastest logic.

The Cypress CY2DP818 fanout buffer features a single LVDS or a single-ended LVTTTL-compatible input and eight LVPECL output pairs.

Designed for data-communications clock-management applications, the large fanout from a single input reduces loading on the input clock.

The CY2DP818 is ideal for both level translations from single-ended to LVPECL and/or for the distribution of LVPECL-based clock signals.

The Cypress CY2DP818 has configurable input functions. The input is user configurable via the Inconfig pin for single ended or differential input.

- Stresses greater than those listed under absolute maximum ratings may cause permanent damage to the device. This is intended to be a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
