

## SSTV16857 • SSTVN16857

### 14-Bit Register with SSTL-2 Compatible I/O and Reset

#### General Description

The SSTV16857 is a 14-bit register designed for use with 184 and 232 pin PC1600, 2100, and 2700 DDR DIMM applications. The SSTVN16857 is a 14-bit register designed for use with 184 and 232 pin PC3200 DDR DIMM applications. These devices have a differential input clock, SSTL-2 compatible data inputs and a LVCMSO compatible RESET input. These devices have been designed for compliance with the JEDEC DDR module and register specifications.

The devices are fabricated on an advanced submicron CMOS process and are designed to operate at power supplies of less than 3.6V's.

#### Features

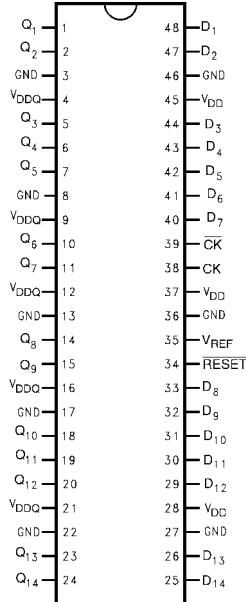

- Compliant with DDR-I registered module specifications
- Operates at  $2.5V \pm 0.2V$   $V_{DD}$
- SSTL-2 compatible input and output structure
- Differential SSTL-2 compatible clock inputs
- Low power mode when device is reset
- Industry standard 48 pin TSSOP package

#### Ordering Code:

Order Number	Package Number	Package Description
SSTV16857MTD	MTD48	48-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 6.1mm Wide
SSTVN16857MTD (Preliminary)	MTD48	48-Lead Thin Shrink Small Outline Package (TSSOP), JEDEC MO-153, 6.1mm Wide

Devices also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code.

## Functional Description

The SSTV16857 and SSTVN16857 are 14-bit registers with SSTL-2 compatible inputs and outputs. Input data is captured by the register on the positive edge crossing of the differential clock pair.

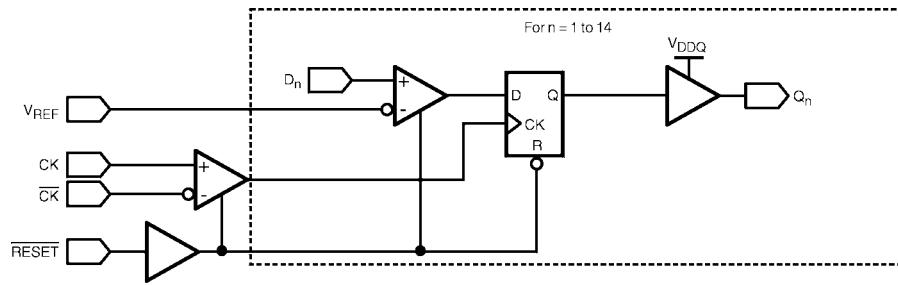

When the LV-CMOS  $\overline{\text{RESET}}$  signal is asserted LOW, all outputs and internal registers are asynchronously placed into the LOW logic state. In addition, the clock and data differential comparators are disabled for power savings. Output glitches are prevented by disabling the internal registers more quickly than the input comparators. When

$\overline{\text{RESET}}$  is removed, the system designer must insure the clock and data inputs to the device are stable during the rising transition of the  $\overline{\text{RESET}}$  signal.

The SSTL-2 data inputs transition based on the value of  $V_{\text{REF}}$ .  $V_{\text{REF}}$  is a stable system reference used for setting the trip point of the input buffers of the SSTV16857/SSTVN16857 and other SSTL-2 compatible devices.

The  $\overline{\text{RESET}}$  signal is a standard CMOS compatible input and is not referenced to the  $V_{\text{REF}}$  signal.

**Note 1:** The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

**Note 2:** IO Absolute Maximum Rating must be observed.

**Note 3:** The RESET input of the device must be held at  $V_{DD}$  or GND to ensure proper device operation. The differential inputs must not be floating, unless RESET is asserted LOW.

**Note A:** All input pulses are supplied by generators having the following characteristics:

$PRR \leq 10$  MHz,  $Z_0 = 50\Omega$ , input slew rate =  $1V/ns \pm 20\%$  (unless otherwise specified).

**Note B:** The outputs are measured one at a time with one transition per measurement.

**Note C:**  $V_{TT} = V_{REF} = V_{DD}/2$ .

**Note D:**  $V_{IH} = V_{REF} + 310$  mV (AC voltage levels) for differential inputs.  $V_{IH} = V_{DD}$  for LVC MOS input.

**Note E:**  $V_{IL} = V_{REF} - 310$  mV (AC voltage levels) for differential inputs.  $V_{IL} = GND$  for LVC MOS input.

**Note F:** Removal time ( $t_{REM}$ ) is tested with one data input held active HIGH. The propagation time from CK to the corresponding output must meet valid timing specifications for the measurement to be accurate.
