PRELIMINARY

CY28SRC02

PCI-Express Clock Generator

Features

- Two 100-MHz differential SRC clocks
- Low-voltage frequency select input
- I^2C support with readback capabilities
- Ideal Lexmark Spread Spectrum profile for maximum electromagnetic interference (EMI) reduction
- 3.3V power supply
- 20-pin TSSOP package

Pin Description

Pin No.	Name	Type	Description
10	IREF	I	A precision resistor (475Ω) attached to this pin is connected to the internal current reference.
18	SCLK	I,PU	**SMBus compatible SCLOCK**.This pin has an internal pull-up, but is tri-stated in power-down.
19	SDATA	I/O, PU	**SMBus compatible SDATA**.This pin has an internal pull-up, but is tri-stated in power-down.
3, 4, 5, 6	SRC[T/C][2:1]	O, DIF	**Differential Selectable Serial reference clocks**. Intel Type-X buffer.
15	XIN	I	**14.318-MHz Crystal Input**
16	XOUT	O	**14.318-MHz Crystal Output**
2, 8, 20	VDD_SRC	PWR	**3.3V power supply for SRC outputs**
1, 7, 9	VSS_SRC	GND	**Ground for SRC outputs**
12	VDDA	PWR	**3.3V power supply for PLL**
11	VSSA	GND	**Analog Ground**
14	VDD_REF	PWR	**Power for Xtal**
13	VSS_REF	GND	**Ground for Xtal**
17	NC	NC	**No Connect**

Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. Through the Serial Data Interface, various device functions, such as individual clock output buffers, can be individually enabled or disabled. The registers associated with the Serial Data Interface initialize to their default setting upon power-up, and therefore use of this interface is optional. Clock device register changes are normally made upon system initialization, if any are required. The interface cannot be used during system operation for power management functions.

Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write, and block read operations from the controller. For block write/read operation, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte has been transferred. For byte write and byte read operations, the system controller can access individually indexed bytes. The offset of the indexed byte is encoded in the command code, as described in *Table 1*.

The block write and block read protocol is outlined in *Table 2* while *Table 3* outlines the corresponding byte write and byte read protocol. The slave receiver address is 11010010 (D2h).

Crystal Recommendations

The CY28SRC02 requires a Parallel Resonance Crystal. Substituting a series resonance crystal will cause the CY28SRC02 to operate at the wrong frequency and violate the ppm specification. For most applications there is a 300-ppm frequency shift between series and parallel crystals due to incorrect loading.

Table 4. Crystal Recommendations

Frequency (Fund)	Cut	Loading	Load Cap	Drive (max.)	Shunt Cap (max.)	Tolerance (max.)	Stability (max.)	Aging (max.)
14.31818 MHz	AT	Parallel	12pF - 16pF	1 mW	7 pF	± 50ppm	± 50ppm	5 ppm

Crystal Loading

Crystal loading plays a critical role in achieving low ppm performance. To realize low ppm performance, the total capacitance the crystal will see must be considered to calculate the appropriate capacitive loading (CL).

Figure 1 shows a typical crystal configuration using the two trim capacitors. An important clarification for the following discussion is that the trim capacitors are in series with the crystal not parallel. It's a common misconception that load capacitors are in parallel with the crystal and should be approximately equal to the load capacitance of the crystal. This is not true.

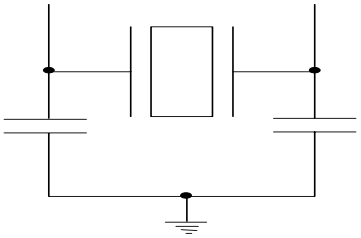

Figure 1. Crystal Capacitive Clarification

Calculating Load Capacitors

In addition to the standard external trim capacitors, trace capacitance and pin capacitance must also be considered to correctly calculate crystal loading. As mentioned previously, the capacitance on each side of the crystal is in series with the crystal. This means the total capacitance on each side of the crystal must be twice the specified crystal load capacitance (CL). While the capacitance on each side of the crystal is in series with the crystal, trim capacitors (Ce1,Ce2) should be calculated to provide equal capacitive loading on both sides.

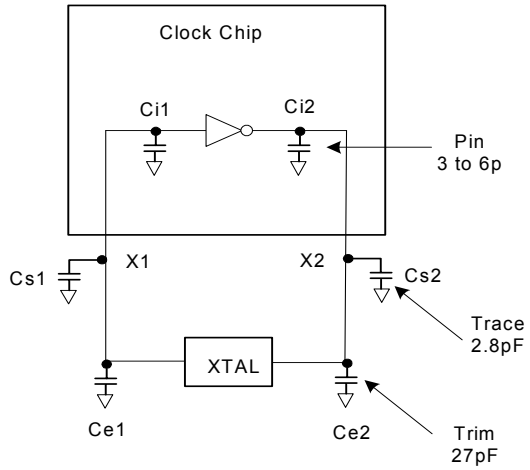

Figure 2. Crystal Loading Example

As mentioned previously, the capacitance on each side of the crystal is in series with the crystal. This mean the total capacitance on each side of the crystal must be twice the specified load capacitance (CL). While the capacitance on each side of the crystal is in series with the crystal, trim capacitors (Ce1,Ce2) should be calculated to provide equal capacitance loading on both sides.

Use the following formulas to calculate the trim capacitor values for Ce1 and Ce2.

Load Capacitance (each side)

$$Ce = 2 * CL - (Cs + Ci)$$

Total Capacitance (as seen by the crystal)

$$CLe = \frac{1}{\left(\frac{1}{Ce1 + Cs1 + Ci1} + \frac{1}{Ce2 + Cs2 + Ci2}\right)}$$

CL .....Crystal load capacitance

CLe ..... Actual loading seen by crystal using standard value trim capacitors

Ce ..... External trim capacitors

Cs .....Stray capacitance (terraced)

Ci ..... Internal capacitance (lead frame, bond wires etc.)
