

Pin Descriptions

Pin No.	Name	Type	Description
1	PCIF1	O, SE	33 MHz clock output
2	VTT_PWRGD#/PD	I, PD	3.3V LVTTTL input. This pin is a level sensitive strobe used to latch the FS[C:A], ITP_SEL, FCTSEL[1:0], SEL_CLKREQ#. After VTT_PWRGD# (active LOW) assertion, this pin becomes a real-time input for asserting power-down (active HIGH).
3	VDD48	PWR	3.3V power supply.
4	FSA/48M	I/O	3.3V-tolerant input for CPU frequency selection / Fixed 48 MHz clock output. Refer to DC Electrical Specification Table for Vil_FS and Vih_FS specifications.
5	VSS48	GND	Ground.
6, 7	DOT96T/27M_non spread DOT96C/27M_Spread	O, DIF	Fixed 96 MHz differential clock output / Single ended 27 MHz clock outputs. When configured for 27 MHz, only the clock on pin 7 contains spread. Selected via FCTSEL[0:1] at VTT_PWRGD# assertion.
8	FSB	I	3.3V-tolerant input for CPU frequency selection. Refer to DC Electrical Specification Table for Vil_FS and Vih_FS specifications
9, 20, 25, 34, 59, 60	CLKREQ#[1], [3:6], [8]	I, PU	3.3V LVTTTL input for enabling assigned SRC clock (active LOW)
10, 11	SRC[T/C]0/ LCD100M[T/C]	O,DIF	100 MHz differential serial reference clock output / 100 MHz LVDS differential clock output. Selected via FCTSEL[0:1] at VTT_PWRGD# assertion
12, 17, 28, 35	VDD_SRC	PWR	3.3V power supply
13,14, 15, 16, 18, 19, 21, 22, 23, 24, 26, 27, 29, 30, 32, 33,	SRC[T/C][1:8]	O, DIF	100 MHz differential serial reference clock outputs.
31	VSS_SRC	GND	Ground.
36, 37	CPUT2_ITP/SRCT10, CPUC2_ITP/SRCC10	O, DIF	Selectable differential CPU / SRC clock output. ITP_EN = 0 @ VTT_PWRGD# assertion = SRC10 (default) ITP_EN = 1 @ VTT_PWRGD# assertion =CPU2_ITP
38	VDDA	PWR	3.3V power supply for PLL.
39	VSSA	GND	Ground for PLL.
40	IREF	I	A precision resistor is attached to this pin, which is connected to the internal current reference.
41, 42, 44, 45	CPU[T/C][0:1]	O, DIF	Differential CPU clock outputs.
43	VDD_CPU	PWR	3.3V power supply
46	VSS_CPU	GND	Ground
47	SCLK	I	SMBus-compatible SCLOCK.
48	SDATA	I/O, OD	SMBus-compatible SDATA.
49	VDD_REF	PWR	3.3V power supply
50	XOUT	O, SE	14.318 MHz crystal output.
51	XIN	I	14.318 MHz crystal input.

Table 1. Frequency Select Table FSA, FSB and FSC

FSC	FSB	FSA	CPU	SRC	PCIF/PCI	27MHz	REF0	DOT96	USB
1	0	1	100 MHz	100 MHz	33 MHz	27 MHz	14.318 MHz	96 MHz	48 MHz
0	0	1	133 MHz	100 MHz	33 MHz	27 MHz	14.318 MHz	96 MHz	48 MHz
0	1	1	166 MHz	100 MHz	33 MHz	27 MHz	14.318 MHz	96 MHz	48 MHz
0	1	0	200 MHz	100 MHz	33 MHz	27 MHz	14.318 MHz	96 MHz	48 MHz

Frequency Select Pins (FSA, FSB, and FSC)

Host clock frequency selection is achieved by applying the appropriate logic levels to FSA, FSB, FSC inputs prior to VTT_PWRGD# assertion (as seen by the clock synthesizer). Upon VTT_PWRGD# being sampled low by the clock chip (indicating processor VTT voltage is stable), the clock chip samples the FSA, FSB, and FSC input values. For all logic levels of FSA, FSB, and FSC, VTT_PWRGD# employs a one-shot functionality in that once a valid low on VTT_PWRGD# has been sampled, all further VTT_PWRGD#, FSA, FSB, and FSC transitions will be ignored, except in test mode.

Serial Data Interface

To enhance the flexibility and function of the clock synthesizer, a two-signal serial interface is provided. Through the Serial Data Interface, various device functions, such as individual clock output buffers, can be individually enabled or disabled. The registers associated with the Serial Data Interface initialize to their default setting upon power-up, and therefore use of this interface is optional. Clock device register changes are normally made upon system initialization, if any are required. The interface cannot be used during system operation for power management functions.

Data Protocol

The clock driver serial protocol accepts byte write, byte read, block write, and block read operations from the controller. For block write/read operation, the bytes must be accessed in sequential order from lowest to highest byte (most significant bit first) with the ability to stop after any complete byte has been transferred. For byte write and byte read operations, the

system controller can access individually indexed bytes. The offset of the indexed byte is encoded in the command code, as described in *Table 2*.

The block write and block read protocol is outlined in *Table 3* while *Table 4* outlines the corresponding byte write and byte read protocol. The slave receiver address is 11010010 (D2h).

Table 2. Command Code Definition

Bit	Description
7	0 = Block read or block write operation, 1 = Byte read or byte write operation
(6:0)	Byte offset for byte read or byte write operation. For block read or block write operations, these bits should be '0000000'

Table 3. Block Read and Block Write Protocol

Block Write Protocol		Block Read Protocol	
Bit	Description	Bit	Description
1	Start	1	Start
8:2	Slave address – 7 bits	8:2	Slave address – 7 bits
9	Write	9	Write
10	Acknowledge from slave	10	Acknowledge from slave
18:11	Command Code – 8 bits	18:11	Command Code – 8 bits
19	Acknowledge from slave	19	Acknowledge from slave
27:20	Byte Count – 8 bits (Skip this step if I ² C_EN bit set)	20	Repeat start
28	Acknowledge from slave	27:21	Slave address – 7 bits
36:29	Data byte 1 – 8 bits	28	Read = 1
37	Acknowledge from slave	29	Acknowledge from slave
45:38	Data byte 2 – 8 bits	37:30	Byte Count from slave – 8 bits
46	Acknowledge from slave	38	Acknowledge
....	Data Byte /Slave Acknowledges	46:39	Data byte 1 from slave – 8 bits
....	Data Byte N – 8 bits	47	Acknowledge
....	Acknowledge from slave	55:48	Data byte 2 from slave – 8 bits
....	Stop	56	Acknowledge
		Data bytes from slave / Acknowledge
		Data Byte N from slave – 8 bits
		NOT Acknowledge
		Stop

Table 4. Byte Read and Byte Write Protocol

Byte Write Protocol		Byte Read Protocol	
Bit	Description	Bit	Description
1	Start	1	Start
8:2	Slave address – 7 bits	8:2	Slave address – 7 bits
9	Write	9	Write
10	Acknowledge from slave	10	Acknowledge from slave
18:11	Command Code – 8 bits	18:11	Command Code – 8 bits
19	Acknowledge from slave	19	Acknowledge from slave
27:20	Data byte – 8 bits	20	Repeated start
28	Acknowledge from slave	27:21	Slave address – 7 bits
29	Stop	28	Read
		29	Acknowledge from slave
		37:30	Data from slave – 8 bits
		38	NOT Acknowledge
		39	Stop

Table 5. Crystal Recommendations

Frequency (Fund)	Cut	Loading	Load Cap	Drive (max.)	Shunt Cap (max.)	Motional (max.)	Tolerance (max.)	Stability (max.)	Aging (max.)
14.31818 MHz	AT	Parallel	20 pF	0.1 mW	5 pF	0.016 pF	35 ppm	30 ppm	5 ppm

The CY28445-5 requires a Parallel Resonance Crystal. Substituting a series resonance crystal will cause the CY28445-5 to operate at the wrong frequency and violate the ppm specification. For most applications there is a 300-ppm frequency shift between series and parallel crystals due to incorrect loading.

Crystal Loading

Crystal loading plays a critical role in achieving low ppm performance. To realize low ppm performance, the total capacitance the crystal will see must be considered to calculate the appropriate capacitive loading (CL).

Figure 1 shows a typical crystal configuration using the two trim capacitors. An important clarification for the following discussion is that the trim capacitors are in series with the crystal not parallel. It's a common misconception that load capacitors are in parallel with the crystal and should be approximately equal to the load capacitance of the crystal. This is not true.

Figure 1. Crystal Capacitive Clarification

Calculating Load Capacitors

In addition to the standard external trim capacitors, trace capacitance and pin capacitance must also be considered to correctly calculate crystal loading. As mentioned previously, the capacitance on each side of the crystal is in series with the crystal. This means the total capacitance on each side of the crystal must be twice the specified crystal load capacitance (CL). While the capacitance on each side of the crystal is in series with the crystal, trim capacitors (Ce1,Ce2) should be calculated to provide equal capacitive loading on both sides.

Figure 2. Crystal Loading Example

Use the following formulas to calculate the trim capacitor values for Ce1 and Ce2.

Load Capacitance (each side)

$$C_e = 2 * CL - (C_s + C_i)$$

Total Capacitance (as seen by the crystal)

$$CL_e = \frac{1}{\left(\frac{1}{C_{e1} + C_{s1} + C_{i1}} + \frac{1}{C_{e2} + C_{s2} + C_{i2}} \right)}$$

CL.....Crystal load capacitance

CLe..... Actual loading seen by crystal using standard value trim capacitors

Ce..... External trim capacitors

Cs..... Stray capacitance (terraced)

Ci Internal capacitance (lead frame, bond wires etc.)

CLKREQ# Description

The CLKREQ# signals are active LOW inputs used for clean enabling and disabling selected SRC outputs. The outputs controlled by CLKREQ# are determined by the settings in register byte 8. The CLKREQ# signal is a de-bounced signal in that it's state must remain unchanged during two consecutive rising edges of SRCC to be recognized as a valid assertion or deassertion. (The assertion and deassertion of this signal is absolutely asynchronous.).

Figure 3. CLK_REQ# Deassertion/Assertion Waveform

CLKREQ# Assertion (CLKREQ# -> LOW)

All differential outputs that were stopped are to resume normal operation in a glitch free manner. The maximum latency from the assertion to active outputs is between 2–6 SRC clock periods (2 clocks are shown) with all SRC outputs resuming simultaneously. All stopped SRC outputs must be driven high within 10 ns of CLKREQ# deassertion to a voltage greater than 200 mV.

CLKREQ# Deassertion (CLKREQ# -> HIGH)

The impact of deasserting the CLKREQ# pins is all SRC outputs that are set in the control registers to stoppable via deassertion of CLKREQ# are to be stopped after their next transition. The final state of all stopped DIF signals is low, both SRCT clock and SRCC clock outputs will not be driven. PD (Power-down) Clarification

The VTT_PWRGD# /PD pin is a dual-function pin. During initial power-up, the pin functions as VTT_PWRGD#. Once VTT_PWRGD# has been sampled low by the clock chip, the pin assumes PD functionality. The PD pin is an asynchronous active high input used to shut off all clocks cleanly prior to shutting off power to the device. This signal is synchronized internal to the device prior to powering down the clock synthesizer. PD is also an asynchronous input for powering up the system. When PD is asserted high, all clocks need to be driven to a low value and held prior to turning off the VCOs and the crystal oscillator.

PD Assertion

When PD is sampled high by two consecutive rising edges of CPUC, all single-ended outputs will be held low on their next high to low transition and differential clocks must held high or tri-stated (depending on the state of the control register drive mode bit) on the next diff clock# high to low transition within 4 clock periods. When the SMBus PD drive mode bit corresponding to the differential (CPU, SRC, and DOT) clock output of interest is programmed to '0', the clock output are held with "Diff clock" pin driven high at 2 x Iref, and "Diff clock#" tristate. If the control register PD drive mode bit corresponding to the output of interest is programmed to "1", then both the "Diff clock" and the "Diff clock#" are tri-state. Note the example below shows CPUT = 133 MHz and PD drive mode = '1' for all differential outputs. This diagram and description is applicable to valid CPU frequencies 100, 133, 166, and 200 MHz. In the event that PD mode is desired as the initial power-on state, PD must be asserted high in less than 10 μ s after asserting Vtt_PwrGd#. It should be noted that 96_100_SSC will follow the DOT waveform is selected for 96 MHz and the SRC waveform when in 100-MHz mode.

Figure 4. PD Assertion Timing Waveform

PD Deassertion

The power-up latency is less than 1.8 ms. This is the time from the deassertion of the PD pin or the ramping of the power supply until the time that stable clocks are output from the clock chip. All differential outputs stopped in a three-state condition resulting from power down will be driven high in less than 300 μ s of PD deassertion to a voltage greater than

200 mV. After the clock chip's internal PLL is powered up and locked, all outputs will be enabled within a few clock cycles of each other. Below is an example showing the relationship of clocks coming up. It should be noted that 96_100_SSC will follow the DOT waveform is selected for 96 MHz and the SRC waveform when in 100-MHz mode.

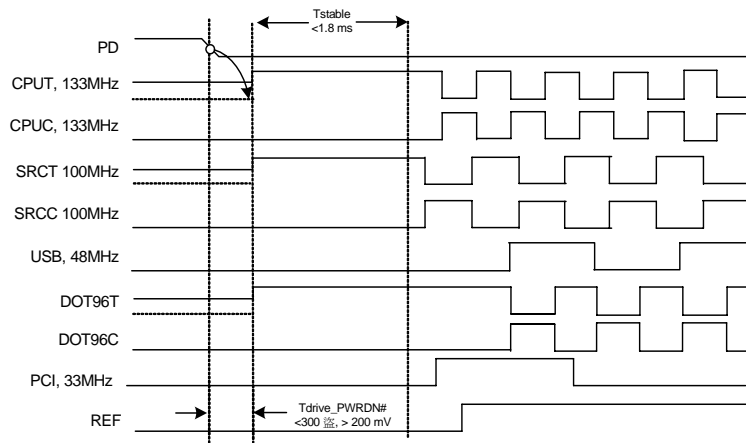

Figure 5. PD Deassertion Timing Waveform

CPU_STP# Assertion

The CPU_STP# signal is an active low input used for synchronous stopping and starting the CPU output clocks while the rest of the clock generator continues to function. When the CPU_STP# pin is asserted, all CPU outputs that are set with the SMBus configuration to be stoppable via assertion

of CPU_STP# will be stopped within two–six CPU clock periods after being sampled by two rising edges of the internal CPUC clock. The final states of the stopped CPU signals are CPU_T = HIGH and CPU_C = LOW. There is no change to the output drive current values during the stopped state. The CPU_T is driven HIGH with a current value equal to $6 \times (I_{ref})$, and the CPU_C signal will be Tri-stated.

Figure 6. CPU_STP# Assertion Waveform

CPU_STP# Deassertion

The deassertion of the CPU_STP# signal will cause all CPU outputs that were stopped to resume normal operation in a

synchronous manner. Synchronous manner meaning that no short or stretched clock pulses will be produced when the clock resumes. The maximum latency from the deassertion to active outputs is no more than two CPU clock cycles.

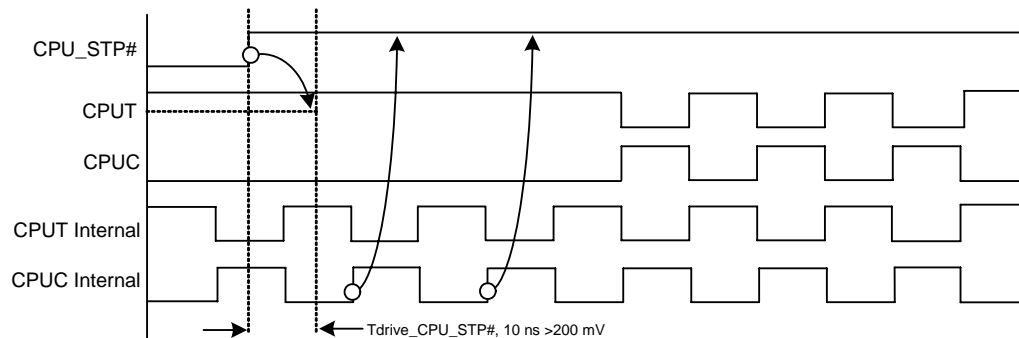

Figure 7. CPU_STP# Deassertion Waveform

Figure 8. CPU_STOP# = Driven, CPU_PD = Driven, DOT_PD = Driven

Figure 9. CPU_STOP# = Tri-state, CPU_PD = Tri-state, DOT_PD = Tri-state

PCI_STOP# Assertion

The PCI_STOP# signal is an active LOW input used for synchronous stopping and starting the PCI outputs while the rest of the clock generator continues to function. The set-up time for capturing PCI_STOP# going LOW is 10 ns (t_{SU}). (See

Figure 10.) The PCIF clocks will not be affected by this pin if their corresponding control bit in the SMBus register is set to allow them to be free running.

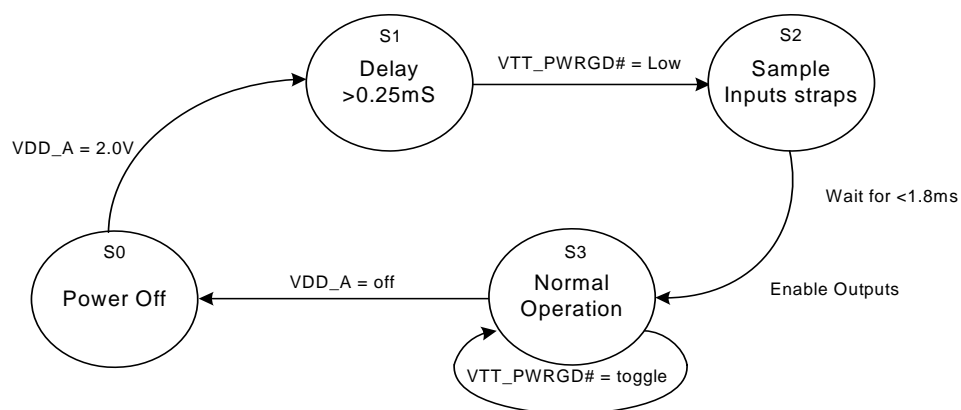

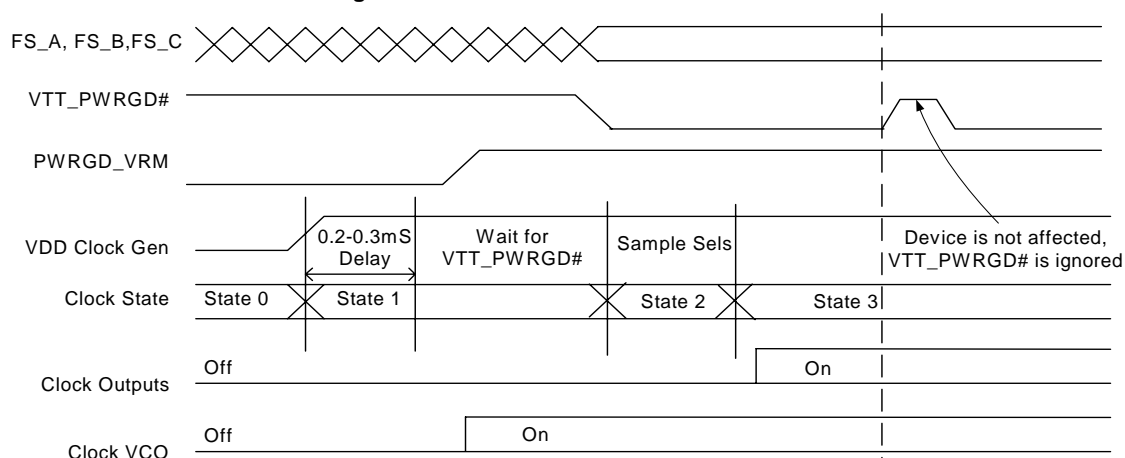

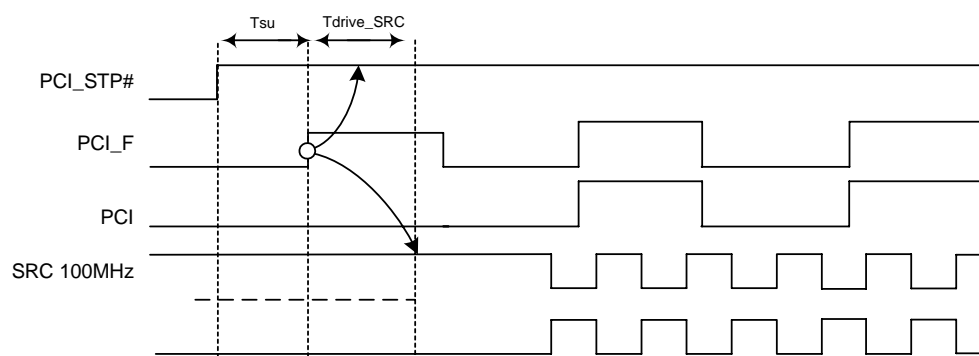

Figure 10. PCI_STOP# Assertion Waveform

T _{DC}	PCI Duty Cycle	Measurement at 1.5V	45	55	%
T _{PERIOD}	Spread Disabled PCIF/PCI Period	Measurement at 1.5V	29.99100	30.00900	ns
T _{PERIODSS}	Spread Enabled PCIF/PCI Period, SSC	Measurement at 1.5V	29.9910	30.15980	ns
T _{PERIODAbs}	Spread Disabled PCIF/PCI Period	Measurement at 1.5V	29.49100	30.50900	ns
T _{PERIODSSAbs}	Spread Enabled PCIF/PCI Period, SSC	Measurement at 1.5V	29.49100	30.65980	ns
T _{HIGH}	PCIF and PCI high time	Measurement at 2.4V	11.6	–	ns
T _{LOW}	PCIF and PCI low time	Measurement at 0.4V	12.0	–	ns
T _R / T _F	PCIF/PCI rising and falling Edge Rate	Measured between 0.8V and 2.0V	0.5	4.0	V/ns
T _{SKEW}	Any PCI clock to Any PCI clock Skew	Measurement at 1.5V	–	500	ps
T _{CCJ}	PCIF and PCI Cycle to Cycle Jitter	Measurement at 1.5V	–	500 ^[1]	ps
L _{ACC}	PCIF/PCI Long Term Accuracy	Measured at crossing point V _{OX}	–	300	ppm
DOT96 at 0.7V					
T _{DC}	DOT96T and DOT96C Duty Cycle	Measured at crossing point V _{OX}	45	55	%
T _{PERIOD}	DOT96T and DOT96C Period	Measured at crossing point V _{OX}	10.41354	10.41979	ns
T _{PERIODAbs}	DOT96T and DOT96C Absolute Period	Measured at crossing point V _{OX}	10.16354	10.66979	ns
T _{CCJ}	DOT96T/C Cycle to Cycle Jitter	Measured at crossing point V _{OX}	–	250	ps
L _{ACC}	DOT96T/C Long Term Accuracy	Measured at crossing point V _{OX}	–	300	ppm
T _R / T _F	DOT96T and DOT96C Rise and Fall Time	Measured from V _{OL} = 0.175 to V _{OH} = 0.525V	175	760	ps
T _{RFM}	Rise/Fall Matching	Determined as a fraction of $2*(T_R - T_F)/(T_R + T_F)$	–	20	%
ΔT _R	Rise Time Variation		–	125	ps
ΔT _F	Fall Time Variation		–	125	ps
V _{HIGH}	Voltage High	Math averages <i>Figure 15</i>	660	850	mV
V _{LOW}	Voltage Low	Math averages <i>Figure 15</i>	–150	–	mV
V _{OX}	Crossing Point Voltage at 0.7V Swing		250	550	mV
V _{OVS}	Maximum Overshoot Voltage		–	V _{HIGH} + 0.3	V
V _{UDS}	Minimum Undershoot Voltage		–0.3	–	V
V _{RB}	Ring Back Voltage	See <i>Figure 15</i> . Measure SE	–	0.2	V
48_M at 3.3V					
T _{DC}	Duty Cycle	Measurement at 1.5V	45	55	%
T _{PERIOD}	Period	Measurement at 1.5V	20.83125	20.83542	ns

AC Electrical Specifications (continued)

Parameter	Description	Condition	Min.	Max.	Unit
T _{PERIODAbs}	Absolute Period	Measurement at 1.5V	20.48125	21.18542	ns
T _{HIGH}	48_M High time	Measurement at 2.4V	8.094	11.036	ns
T _{LOW}	48_M Low time	Measurement at 0.4V	7.694	10.836	ns
T _R / T _F	Rising and Falling Edge Rate	Measured between 0.8V and 2.0V	1.0	2.2	V/ns
T _{CCJ}	Cycle to Cycle Jitter	Measurement at 1.5V	–	350	ps
L _{ACC}	48M Long Term Accuracy	Measured at crossing point V _{OX}	–	100	ppm
27_M at 3.3V					
T _{DC}	Duty Cycle	Measurement at 1.5V	45	55	%
T _{PERIOD}	Spread Disabled 27M Period	Measurement at 1.5V	27.000	27.0547	ns
	Spread Enabled 27M Period	Measurement at 1.5V	27.000	27.0547	
T _{HIGH}	27_M High time	Measurement at 2.0V	10.5	–	ns
T _{LOW}	27_M Low time	Measurement at 0.8V	10.5	–	ns
T _R / T _F	Rising and Falling Edge Rate	Measured between 0.8V and 2.0V	1.0	4.0	V/ns
T _{CCJ}	Cycle to Cycle Jitter	Measurement at 1.5V	–	500	ps
L _{ACC}	27_M Long Term Accuracy	Measured at crossing point V _{OX}	–	0	ppm
REF at 3.3V					
T _{DC}	REF Duty Cycle	Measurement at 1.5V	45	55	%
T _{PERIOD}	REF Period	Measurement at 1.5V	69.8203	69.8622	ns
T _{PERIODAbs}	REF Absolute Period	Measurement at 1.5V	68.82033	70.86224	ns
T _R / T _F	REF Rising and Falling Edge Rate	Measured between 0.8V and 2.0V	0.9	4.0	V/ns
T _{SKEW}	REF Clock to REF Clock	Measurement at 1.5V	–	500	ps
T _{CCJ}	REF Cycle to Cycle Jitter	Measurement at 1.5V	–	1000	ps
L _{ACC}	Long Term Accuracy	Measurement at 1.5V	–	300	ppm
ENABLE/DISABLE and SET-UP					
T _{STABLE}	Clock Stabilization from Power-up		–	1.8	ms
T _{SS}	Stopclock Set-up Time		10.0	–	ns
T _{SH}	Stopclock Hold Time		0	–	ns

Note:

1. Measured under typical condition.

Test and Measurement Set-up
For PCI Single-ended Signals and Reference

The following diagram shows the test load configuration of single-ended PCI, USB output signals.

Figure 14. Single-ended PCI, USB Load Configuration

The following diagram shows the test load configuration for the differential CPU and SRC outputs.

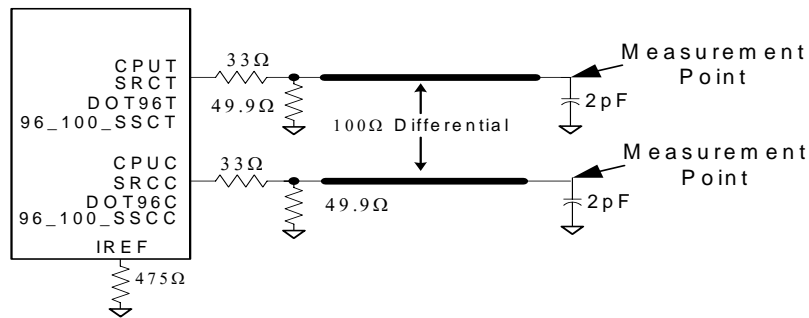

Figure 15. 0.7V Differential Load Configuration

Figure 16. Single-ended Output Signals (for AC Parameters Measurement)

Ordering Information

Part Number	Package Type	Product Flow
Lead-free		
CY28445LFXC-5	68-pin QFN	Commercial
CY28445LFXC-5T	68-pin QFN - Tape and Reel	Commercial

Package Drawing and Dimensions

68-Lead QFN 8 x 8 mm (0.4-mm Pitch) LY68A (Type I)

DIMENSIONS IN MM(INCHES)
REFERENCE JEDEC MO-220
PACKAGE WEIGHT: 0.17 grams

68-Lead QFN 8 x 8 mm (0.4-mm Pitch) LY68A (Type II)

NOTES:
1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. DIMENSIONAL TOLERANCE UNLESS OTHERWISE SPECIFIED ±0.10.
3. THE SURFACE OF THE PACKAGE SHALL BE RZ 1.6-8.0μ.
4. PROTRUSIONS AT PKG OUTLINE SHALL NOT EXCEED 0.10.

SYMBOL	COMMON DIMENSIONS		
	MIN	NOM	MAX
A	0.70	0.75	0.80
A2	0.20 REF.		
b	0.09	0.14	0.19
D	7.90	8.00	8.10
D2	3.35	3.50	3.65
E	7.90	8.00	8.10
E2	3.35	3.50	3.65
e	0.40 B.S.C.		
k	1.71	—	—
L	0.40	0.50	0.60

Document History Page

Document Title: CY28445-5 Clock Generator for Intel® Calistoga Chipset			
REV.	Issue Date	Orig. of Change	Description of Change
1.0	11/21/06	JMA	New datasheet
1.1	06/30/07	BSHEN	1. Add new QFN 68 package dimension

While SLI has reviewed all information herein for accuracy and reliability, Spectra Linear Inc. assumes no responsibility for the use of any circuitry or for the infringement of any patents or other rights of third parties which would result from each use. This product is intended for use in normal commercial applications and is not warranted nor is it intended for use in life support, critical medical instruments, or any other application requiring extended temperature range, high reliability, or any other extraordinary environmental requirements unless pursuant to additional processing by Spectra Linear Inc., and expressed written agreement by Spectra Linear Inc. Spectra Linear Inc. reserves the right to change any circuitry or specification without notice.
