

Pentium®/II Clock Synthesizer/Driver for Desktop PCs with Intel 82440LX with 3 DIMMs

Features

- Mixed 2.5V and 3.3V operation
- Clock solution to meet requirements of Pentium® and Pentium® II motherboards
 - Four CPU clocks at 2.5V
 - Up to twelve 3.3V SDRAM clocks
 - Seven synchronous PCI clocks
 - Two 2.5V IOAPIC clocks at 14.318 MHz
 - One 3.3V Ref. clock at 14.318 MHz
- 1 ns–5.8 ns CPU-PCI delay, factory-EPROM programmable
- I²C™ Serial Configuration Interface
- Factory-EPROM programmable output drive and slew rate for EMI customization
- Factory-EPROM programmable CPU clock frequencies for custom configurations
- Powerdown, CPU stop and PCI stop pins for power management
- High drive, low skew (<250ps) and low jitter outputs
- Intel Test Mode support
- Available in space-saving 48-pin SSOP package

Functional Description

The CY2275A is a Clock Synthesizer/Driver for a Pentium and Pentium II-based PCs using an Intel 82440LX or similar core-logic chipset.

The CY2275A outputs four CPU clocks at 2.5V. There are seven PCI clocks, running at one half the CPU clock frequency.

One of the PCI clocks is free-running. Additionally, the part outputs twelve 3.3V SDRAM clocks, two 2.5V IOAPIC clocks at 14.318 MHz, and one 3.3V reference clock at 14.318 MHz.

The part has power-down, CPU stop, and PCI stop pins for power management control. These inputs are multiplexed with SDRAM clock outputs, and are selected when the MODE pin is driven LOW. Additionally, these inputs are synchronized on-chip, enabling glitch-free output transitions. When the CPU_STOP input is asserted, the CPU clock outputs are driven LOW. When the PCI_STOP input is asserted, the PCI clock outputs (except the free-running PCI clock) are driven LOW. Finally, when the PWR_DWN pin is asserted, the reference oscillator and PLLs are shut down, and all outputs are driven LOW.

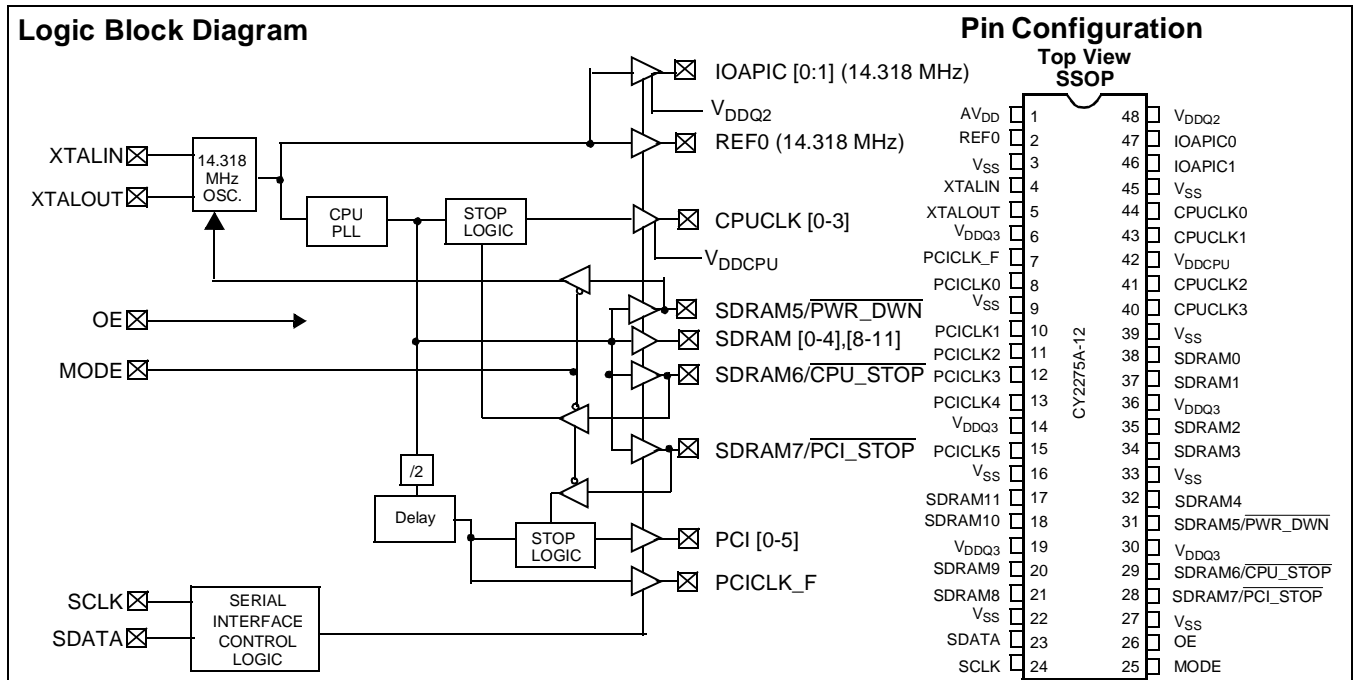

The CY2275A outputs are designed for low EMI emission. Controlled rise and fall times, unique output driver circuits and factory-EPROM programmable output drive and slew-rate enable optimal configurations for EMI control.

Notes:

8. CPUCLK on and CPUCLK off latency is 2 or 3 CPUCLK cycles.
9. CPU_STOP may be applied asynchronously. It is synchronized internally.
10. PCICLK on and PCICLK off latency is 1 rising edge of the external PCICLK.
11. PCI_STOP may be applied asynchronously. It is synchronized internally.

Shaded section on the VCO and Crystal waveforms indicates that the VCO and crystal oscillator are active, and there is a valid clock.

Timing Requirements for the I²C Bus

Application Information

Clock traces must be terminated with either series or parallel termination, as they are normally done.

Application Circuit

Cd = DECOUPLING CAPACITORS

Ct = OPTIONAL EMI-REDUCING CAPACITORS

Cx = OPTIONAL LOAD MATCHING CAPACITOR

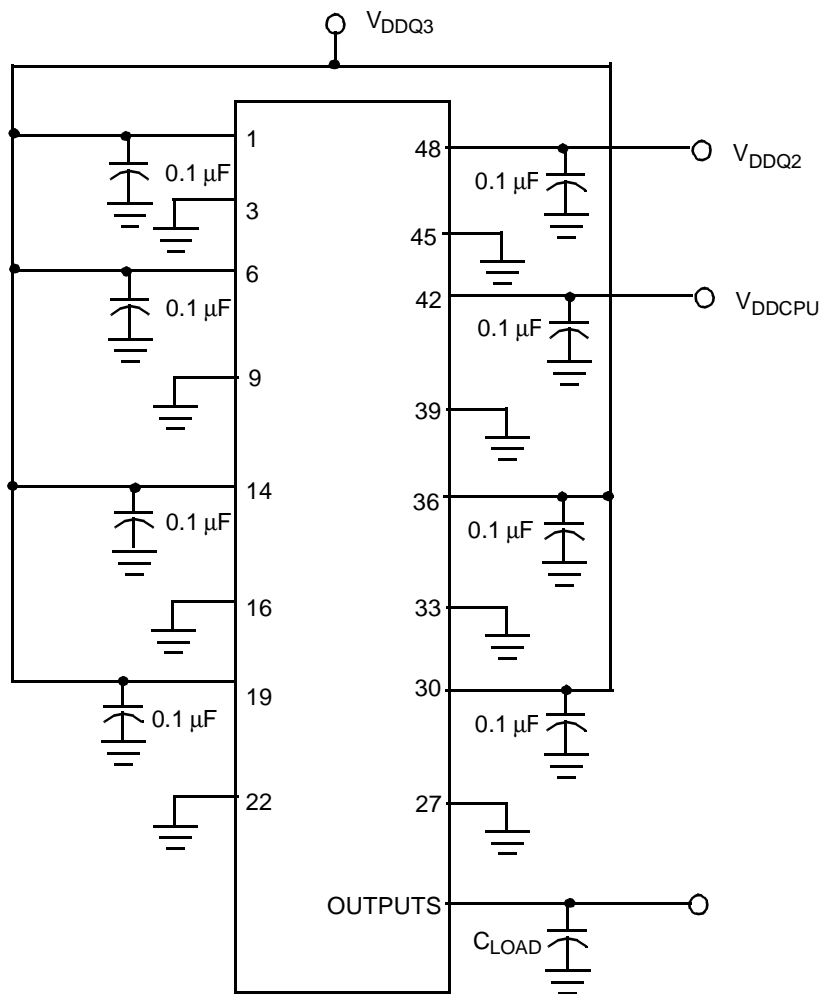

Rs = SERIES TERMINATING RESISTORS

Summary

- A parallel-resonant crystal should be used as the reference to the clock generator. The operating frequency and C_{LOAD} of this crystal should be as specified in the data sheet. Optional trimming capacitors may be needed if a crystal with a different C_{LOAD} is used. Footprints must be laid out for flexibility.
- Surface mount, low-ESR, ceramic capacitors should be used for filtering. Typically, these capacitors have a value of 0.1 μF . In some cases, smaller value capacitors may be required.
- The value of the series terminating resistor satisfies the following equation, where R_{trace} is the loaded characteristic impedance of the trace, R_{out} is the output impedance of the clock generator (specified in the data sheet), and R_{series} is the series terminating resistor.

$$R_{series} \geq R_{trace} - R_{out}$$

- Footprints must be laid out for optional EMI-reducing capacitors, which should be placed as close to the terminating resistor as is physically possible. Typical values of these capacitors range from 4.7 pF to 22 pF.
- A Ferrite Bead **may** be used to isolate the Board V_{DD} from the clock generator V_{DD} island. Ensure that the Ferrite Bead offers greater than 50 Ω impedance at the clock frequency, under loaded DC conditions. Please refer to the application note "Layout and Termination Techniques for Cypress Clock Generators" for more details.
- If a Ferrite Bead is used, a 10 μF –22 μF tantalum bypass capacitor should be placed close to the Ferrite Bead. This capacitor prevents power supply droop during current surges.

Test Circuit

Note: All capacitors should be placed as close to each pin as possible.
