LCD Panel EMI Reduction IC

Features

- FCC approved method of EMI attenuation.
- Provides up to 15dB of EMI suppression
- Generates a low EMI spread spectrum clock of the input frequency
- 50MHz to 170MHz input frequency range
- Optimized for 54MHz, 65MHz, 81MHz, 140MHz, and 162MHz pixel clock frequencies
- Internal loop filter minimizes external components and board space
- 8 selectable spread ranges, up to ± 2.2%
- SSON# control pin for spread spectrum enable and disable options
- 2 selectable modulation rates
- Low Cycle-to-cycle jitter
- 3.3V Operating Voltage
- Ultra low power CMOS design
- Supports most mobile graphic accelerator and LCD timing controller specifications
- Available in 8 pin SOIC and TSSOP Packages

Product Description

The P2040C is a selectable spread spectrum frequency modulator designed specifically for digital flat panel applications. The P2040C reduces electromagnetic interference (EMI) at the clock source which provides system wide reduction of EMI of all clock dependent signals. The P2040C allows significant system cost savings by reducing the number of circuit board layers and shielding that are traditionally required to pass EMI regulations.

The P2040C uses the most efficient and optimized modulation profile approved by the FCC and is implemented in a proprietary all-digital method. The P2040C modulates the output of a single PLL in order to "spread" the bandwidth of a synthesized clock and, more importantly, decreases the peak amplitudes of its harmonics. This result in a significantly lower system EMI compared to the typical narrow band signal produced by oscillators and most frequency generators. Lowering EMI by increasing a signal's bandwidth is called 'spread spectrum clock generation'.

Applications

The P2040C is targeted towards digital flat panel applications for Notebook PCs, Palm-size PCs, Office Automation Equipments and LCD Monitors.

Pin Description

Pin#	Pin Name	Type	Description
1	CLKIN	I	External reference frequency input. Connect to externally generated reference signal.
2	MRA	I	Digital logic input used to select modulation rate. This pin has an internal pull-up resistor.
3	SR1	I	Digital logic input used to select Spreading Range. This pin has an internal pull-up resistor.
4	VSS	P	Ground to entire chip. Connect to system ground.
5	SSON#	I	Digital logic input used to enable Spread Spectrum function (Active LOW). Spread Spectrum function enabled when LOW, disabled when HIGH. This pin has an internal pull-low resistor.
6	ModOUT	O	Spread spectrum Clock Output.
7	SR0	I	Digital logic input used to select Spreading Range. This pin has an internal pull-up resistor.
8	VDD	P	Power supply for the entire chip.

Spread Spectrum Selection

Table 1 illustrates the possible spread spectrum options. The optimal setting should minimize system EMI to the fullest without affecting system performance. The spreading is described as a percentage deviation of the center frequency
(Note: The center frequency is the frequency of the external reference input on CLKIN, Pin 1).

Example: P2040C is designed for high resolution flat panel applications and is able to support panel frequencies from 50MHz to 170MHz. For a 65MHz pixel clock frequency, a spreading selection of MRA=0, SR1=1 and SR0 =1 provides a percentage deviation of ±1.50% (see Table 1). This result in frequency on ModOUT being swept from 64.03MHz to 65.98MHz at a modulation rate of 50.77KHz (see Table 1). This particular example (see Figure below) given here is a common EMI reduction method for notebook LCD panel and has already been implemented by most of the leading OEM and mobile graphic accelerator manufacturers.
