## MP3/USB 2.0 High Speed Switch with Negative Signal Handling/Click and Pop Suppression

The Intersil ISL54210 dual SPDT (Single Pole/Double Throw) switch combines low distortion audio and accurate USB 2.0 high speed data (480Mbps) signal switching in the same low voltage device. When operated with a 2.7 V to 3.6 V single supply, these analog switches allow audio signal swings below-ground, allowing the use of a common USB and audio headphone connector in Personal Media Players and other portable battery powered devices.

The ISL54210 incorporates circuitry for the detection of the USB $V_{B U S}$ voltage, which is used to switch between the audio and USB signal sources.

The part has an audio enable control pin (CTRL) to open all in-line switches and activate the audio click and pop circuitry. The high off-isolation and special click/pop circuitry of the audio switches eliminates click and pops in the head-phones when the audio CODEC drivers are powering up or down or when a headphone is inserted or removed from the headphone jack.

It's available in a tiny 10 Ld $1.8 \mathrm{~mm} \times 1.4 \mathrm{~mm}$ ultra-thin $\mu$ TQFN package and a $10 \mathrm{Ld} 3 \mathrm{~mm} \times 3 \mathrm{~mm}$ TDFN package. It operates over a temperature range of $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## Features

- High Speed (480Mbps) and Full Speed (12Mbps) Signaling Capability per USB 2.0
- Detection of $\mathrm{V}_{\text {BUS }}$ Voltage on USB Cable
- Low Distortion Negative Signal Capability
- Clickless/Popless Audio Switches
- Enable Pin to Open all Switches
- Low Distortion Headphone Audio Signals
- THD+N at 1 mW into $32 \Omega$ Load
. 0.014\%
- Crosstalk (20Hz to 20kHz). . . . . . . . . . . . . . . . . . -100dB
- Off-Isolation ( 20 Hz to 100 kHz ) . . . . . . . . . . . . . . . . 95dB
- Single Supply Operation ( $\mathrm{V}_{\mathrm{DD}}$ ) . . . . . . . . . . . . 2.7V to 3.6 V
- -3dB Bandwidth USB Switch . . . . . . . . . . . . . . . . . 700MHz
- Available in $\mu$ TQFN and TDFN Packages
- Compliant with USB 2.0 Short Circuit Requirements Without Additional External Components
- Pb-Free (RoHS Compliant)

## Applications

- MP3 and other Personal Media Players
- Cellular/Mobile Phones
- PDA's
- Audio/USB Switching

NOTES:
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and $100 \%$ matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations). Intersil Pb -free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. These Intersil Pb-free plastic packaged products employ special Pb-free material sets; molding compounds/die attach materials and NiPdAu plate - e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations. Intersil Pb -free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

## Operating Conditions

Temperature Range . . . . . . . . . . . . . . . . . . . . . . . . . $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

## NOTES:

4. Signals on $\mathrm{D}+, \mathrm{D}-, \mathrm{L}, \mathrm{R}, \mathrm{COM}-, \mathrm{COM}+, \mathrm{CTRL}, \mathrm{V}_{\mathrm{BUS}}$ exceeding $\mathrm{V}_{\mathrm{DD}}$ or $G N D$ by specified amount are clamped. Limit current to maximum current ratings.
5. $\theta_{\mathrm{JA}}$ is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
6. $\theta_{J A}$ is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief TB379.
7. For $\theta_{\mathrm{JC}}$, the "case temp" location is the center of the exposed metal pad on the package underside.

## NOTES:

8. $\mathrm{V}_{\text {logic }}=$ Input voltage to perform proper function.
9. The algebraic convention, whereby the most negative value is a minimum and the most positive a maximum.
10. Parameters with MIN and/or MAX limits are $100 \%$ tested at $+25^{\circ} \mathrm{C}$, unless otherwise specified. Temperature limits established by characterization and are not production tested.
11. Flatness is defined as the difference between maximum and minimum value of ON-resistance over the specified analog signal range.
12. Limits established by characterization and are not production tested.
13. $r_{\mathrm{ON}}$ matching between channels is calculated by subtracting the channel with the highest max $r_{\text {ON }}$ value from the channel with lowest max $\mathrm{r}_{\mathrm{ON}}$ value, between $L$ and $R$ or between $D+$ and $D$-.

## Test Circuits and Waveforms

Logic input waveform is inverted for switches that have the opposite logic sense.

Repeat test for all switches. $C_{L}$ includes fixture and stray capacitance.
$V_{\text {OUT }}=V_{\text {(INPUT) }} \frac{R_{L}}{R_{L}+r_{\text {ON }}}$

## Typical Application Block Diagram

## Detailed Description

The ISL54210 device is a dual single pole/double throw (SPDT) analog switch that operates from a single DC power supply in the range of 2.7 V to 3.6 V . It was designed to function as a dual 2 to 1 multiplexer to select between USB differential data signals and audio $L$ and $R$ stereo signals. It comes in tiny $\mu$ TQFN and TDFN packages for use in MP3 players, PDAs, cellphones, and other personal media players.

The part consists of two $2.5 \Omega$ audio switches and two $5.5 \Omega$ USB switches. The audio switches can accept signals that swing below ground. They were designed to pass audio left and right stereo signals, that are ground referenced, with minimal distortion. The USB switches were designed to pass high-speed USB differential data signals with minimal edge and phase distortion.

The ISL54210 was specifically designed for MP3 players, personal media players and cellphone applications that need to combine the audio headphone jack and the USB data connector into a single shared connector, thereby saving space and component cost. A "Typical Application Block Diagram" of this functionality is shown on page 9.

The ISL54210 incorporates circuitry for the detection of the USB $V_{\text {BUS }}$ voltage, which is used to switch between the audio CODEC drivers and USB transceiver of the MP3 player or cellphone. The ISL54210 contains a logic control pin (CTRL) that when driven low while $V_{B U S}$ is low, opens all switches and activates the audio click and pop circuitry.

A detailed description of the two types of switches are provided in the following sections. In a typical application,
the USB transmission and audio playback are intended to be mutually exclusive operations.

## Audio Switches

The two audio switches ( $\mathrm{L}, \mathrm{R}$ ) are $2.5 \Omega$ switches that can pass signals that swing below ground. Crosstalk between the audio switches is $<-100 \mathrm{~dB}$ over the audio band. These switches have excellent off-isolation >105dB over the audio band with a $32 \Omega$ load.

Over a signal range of $\pm 1 \mathrm{~V}\left(0.707 \mathrm{~V}_{\mathrm{RMS}}\right)$ with $\mathrm{V}_{\mathrm{DD}}>2.7 \mathrm{~V}$, these switches have an extremely low ron resistance variation. They can pass ground referenced audio signals with very low distortion ( $<0.06 \%$ THD+N) when delivering 15.6 mW into a $32 \Omega$ headphone speaker load. See Figures 16, 17, 18, and 19 THD+N in "Typical Performance Curves".

The audio drivers should be connected at the $L$ and $R$ side of the switch (pins 5 and 6 for $\mu$ TQFN, pins 6 and 7 for TDFN) and the speaker loads should be connected at the COM side of the switch (pins 2 and 3 for $\mu$ TQFN, pins 3 and 4 for TDFN).

The audio switches have click and pop circuitry on the $L$ and R side that is activated when the $\mathrm{V}_{\mathrm{B}}$ s voltage is $\leq \mathrm{V}_{\mathrm{DD}}+$ 0.2 V or floating and the CTRL voltage $\leq$ to 0.5 V or floating. The ISL54210 should be put in this mode before powering down or powering up of the audio CODEC drivers. In this mode, both the audio and USB in-line switches will be OFF and the audio click and pop circuitry will be ON. The high off-isolation of the audio switches along with the click and pop circuitry will isolate the transients generated during power-up and power-down of the audio CODECs from
getting through to the headphones, thus eliminating click and pop noise in the headphones.

The audio switches are active (turned ON) whenever the $\mathrm{V}_{\mathrm{B}}$, voltage $\geq$ to 1.4 V .

## USB Switches

The two USB switches (D+, D-) are $5.5 \Omega$ bidirectional switches that were specifically designed to pass high-speed USB differential signals typically in the range of OV to 400 mV . The switches have low capacitance and high bandwidth to pass USB high-speed signals (480Mbps) with minimum edge and phase distortion to meet USB 2.0 signal quality specifications. See Figure 20 for high-speed eye pattern taken with switch in the signal path.

These switches can also swing rail-to-rail and pass USB full-speed signals ( 12 Mbps ) with minimal distortion. See Figure 21 for full-speed eye pattern taken with switch in the signal path.
The maximum signal range for the USB switches is from -1.5 V to $\mathrm{V}_{\mathrm{DD}}$. The signal voltage at D - and $\mathrm{D}+$ should not be allowed to exceed the $\mathrm{V}_{\mathrm{DD}}$ voltage rail or go below ground by more than -1.5 V .

The USB switches are active (turned ON) whenever the $\mathrm{V}_{\mathrm{BUS}}$ voltage is $\geq$ to $\mathrm{V}_{\mathrm{DD}}+0.8 \mathrm{~V}$. $\mathrm{V}_{\mathrm{BUS}}$ is internally pulled low, so when $V_{B U S}$ is floating the USB switches are OFF.

## ISL54210 Operation

The following discusses using the ISL54210 in the "Typical Application Block Diagram" on page 9.

## $V_{D D}$ SUPPLY

The DC power supply connected at $\mathrm{V}_{\mathrm{DD}}$ (pin 10 for $\mu$ TQFN, pin 1 for TDFN) provides the required bias voltage for proper switch operation. Its voltage should be kept in the range of 2.7 V to 3.6 V when used in a USB/Audio application to ensure you get proper switching when the $\mathrm{V}_{\mathrm{B} U S}$ voltage is at its lower limit of 4.4 V .

In a typical USB/Audio application for portable battery powered devices, the $V_{D D}$ voltage will come from a battery or an LDO and be in the range of 2.7 V to 4.3 V . For best possible USB full-speed operation (12Mbps), it is recommended that the $\mathrm{V}_{\mathrm{DD}}$ voltage be $\geq 2.7 \mathrm{~V}$ in order to get a USB data signal level above 2.7V.
Before power-up and power-down of the ISL54210 part, the $V_{B U S}$ and CTRL control pins should be driven to ground or tri-stated. This will put the switch in the mute state which turns all switches OFF and activates the click and pop circuitry. Which will minimize transients at the speaker loads during power-up and power-down.

## LOGIC CONTROL

The state of the ISL54210 device is determined by the voltage at the $V_{\text {BUS }}$ pin (pin 1 for $\mu$ TQFN, pin 2 for TDFN) and the CTRL pin (pin 9 for $\mu$ TQFN, pin 10 for TDFN). The
part has three states or modes of operation: Audio Mode, USB Mode and Mute Mode. Refer to the "Truth Table" on page 2.

The $V_{\text {BUS }}$ pin and CTRL pin are internally pulled low through $4 \mathrm{M} \Omega$ resistors to ground and can be left floating or tri-stated. The CTRL control pin is only active when $V_{B U S}$ is logic " 0 ".

## Logic Control Voltage Levels:

$\mathrm{V}_{\mathrm{BUS}}=$ Logic "0" (Low) when $\mathrm{V}_{\mathrm{BUS}} \leq \mathrm{V}_{\mathrm{DD}}+0.2 \mathrm{~V}$ or Floating.
$\mathrm{V}_{\mathrm{BUS}}=$ Logic " 1 " (High) when $\mathrm{V}_{\mathrm{BUS}} \geq \mathrm{V}_{\mathrm{DD}}+0.8 \mathrm{~V}$
CTRL = Logic " 0 " (Low) when $\leq 0.5 \mathrm{~V}$ or Floating.
CTRL = Logic " 1 " (High) when $\geq 1.4 \mathrm{~V}$

## Audio Mode

If the $V_{B U S}$ pin = Logic "0" and CTRL pin = Logic " 1 ", the part will be in the Audio mode. In Audio mode, the L (left) and R (right) $2.5 \Omega$ audio switches are ON, the D- and $D+5.5 \Omega$ switches are OFF (high impedance) and the audio click and pop circuitry is OFF (high impedance).
In a typical application, $\mathrm{V}_{\mathrm{DD}}$ will be in the range of 2.7 V to 3.6 V and will be connected to the battery or LDO of the MP3 player or cellphone. When a headphone is plugged into the common connector, nothing gets connected at the $\mathrm{V}_{\text {BUS }}$ pin (its internally pulled low) and as long as the CTRL = Logic " 1 " the ISL54210 part remains in the audio mode and the audio drivers of the player can drive the headphones and play music.

## USB Mode

If the $V_{B U S}$ pin = Logic " 1 " and CTRL pin = Logic "0" or Logic " 1 " the part will go into USB mode. In USB mode, the D- and $D+5.5 \Omega$ switches are $O N$ and the $L$ and $R 2.5 \Omega$ audio switches are OFF (high impedance).

When a USB cable from a computer or USB hub is connected at the common connector, the voltage at the $\mathrm{V}_{\mathrm{BUS}}$ pin will be driven to in the range of 4.4 V and 5.25 V . The ISL54210 part will go into the USB mode. In USB mode, the computer or USB hub transceiver and the MP3 player or cellphone USB transceiver are connected and digital data will be able to be transmitted back and forth.
When the USB cable is disconnected the ISL54210 automatically turns the D+ and D- switches OFF.

## Mute Mode

If the $V_{B U S}$ pin = Logic " 0 " and CTRL pin = Logic " 0 ", the part will be in the Mute mode. In the Mute mode, the audio switches and the USB switches are OFF (high impedance) and the audio click and pop circuitry is ON.

Before powering down or powering up of the audio CODECs drivers, the ISL54210 should be put in the Mute mode. In Mute mode transients present at the $L$ and $R$ signal pins due to the changing DC voltage of the audio drivers will not pass to the headphones preventing clicks and pops in the
headphones. See "AC-Coupled click and pop operation" on page 11.

Before power-up and power-down of the ISL54210 part, the $V_{\text {BUS }}$ and CTRL control pins should be driven to ground or tri-stated. This will put the switch in the mute state, which turns all switches OFF and activates the click and pop circuitry. This will minimize transients at the speaker loads during power-up and power-down. See Figure 30 in the "Typical Performance Curves" on page 16.

## AC-COUPLED CLICK AND POP OPERATION

Single supply audio drivers have their signal biased at a DC offset voltage (usually at $1 / 2$ the DC supply voltage of the driver). As this DC bias voltage comes up or goes down during power-up or power-down of the driver, a transient can be coupled into the speaker load through the DC blocking capacitor (see the"Typical Application Block Diagram" on page 9).
When a driver is OFF and suddenly turned ON, the rapidly changing DC bias voltage at the output of the driver will cause an equal voltage at the input side of the switch due to the fact that the voltage across the blocking capacitor cannot change instantly. If the switch is in the Audio mode or there is no low impedance path to discharge the blocking capacitor
voltage at the input of the switch, before turning on the audio switch, a transient discharge will occur in the speaker, generating a click/pop noise.

Proper elimination of a click/pop transient at the speaker loads while powering up or down of the audio drivers requires that the ISL54210 have its click/pop circuitry activated by putting the part in the Mute mode. This allows the transients generated by the audio drivers to be discharged through the click and pop shunt circuitry.
Once the driver DC bias has reached $V_{D D} / 2$ and the transient on the switch side of the DC blocking capacitor has been discharged to ground through the click/pop shunt circuitry, the audio switches can be turned ON and connected through to the speaker loads without generating any undesirable click/pop noise in the speakers.
With a typical DC blocking capacitor of $220 \mu \mathrm{~F}$ and the click/pop shunt circuitry designed to have a resistance of $20 \Omega$ to $70 \Omega$, allowing a 100 ms wait time to discharge the transient before placing the switch in the Audio mode will prevent the transient from getting through to the speaker load. See Figures 28 and 29 in the "Typical Performance Curves" page 16.
